Table A.1: Summarizing information on studies.

**General handling of attrition** For all studies, we evaluated attrition and its possible effects on our results in the same manner. We present for each study an attrition evaluation plot, whereby the x-axis presents in order questions posed to the respondents in the survey experiment. The y-axis denotes the proportion of respondents who attrited (compared to the original starting sample). We indicate through colored vertical lines where Pre-Treatment, Treatment, Mediator (or Other), and Outcome variables are measured. When large proportions of attrition occur at specific moments of the survey, it can become quickly clear to the researcher if these are at key points of the study – such as if it was treatment-induced attrition, which would most directly and problematically affect estimation of average treatment effects. Throughout our studies we see very low attrition (an average of 5%) with no obvious correlations with introduction of treatment.

## B Further details on Measurements

### B.1 Treatments

**Measurement of peer praise** We elicit naturalistic peer praise in Study 2 (see details on the Study in Appendix Section E) in the following manner:

1. We ask respondents to provide feedback on two tasks a real adult has performed – the FEEL and DESCRIBE tasks and explained what each task entailed and an example drawn image of a person.
2. Respondents are asked to think of language that would admire or encourage the participant for choosing and doing the FEEL/DESCRIBE, especially positive things that can be said to people who choose to empathize/be objective to others in order to encourage them. Respondents then are asked for three words, then a full sentence. Finally respondents are asked to select how they feel about people who choose and engage in empathetic/objective behavior in a thermometer from 0-10 with zero as least warm and 10 as most warm.
3. To encourage respondents to think and write genuinely, we ask respondents in a series of follow up questions to tell us what the likelihood participants who are shown their

words will believe that they are genuine, and give respondents the opportunity to return and edit their responses if they desire.

We collected the words used by respondents to praise empathetic behavior and created a word cloud, with a short sentence above indicating the average feeling thermometer value for that behavior, calculated from Study 2 participants. This constitutes the main peer praise for empathy treatment, replicated here and found in the main text as well. We similarly create a peer praise for describe treatment for our robustness checks. Both are found in Figure B.1.

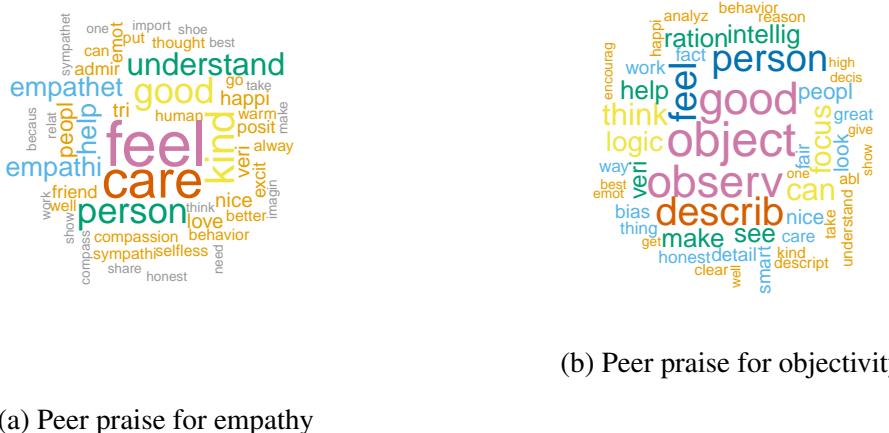

Figure B.1: Left panel (a) main peer praise for empathy treatment; right panel (b) peer praise for objectivity.

## B.2 Dependent variables

**Measurement of main (choice) task** Our main dependent variable is a forced-choice task selection between FEEL and DESCRIBE; for more detail please see Appendix Section C.1.

**Measurement of reservation wage** Our secondary dependent variable is an incentivized reservation wage elicitation for the FEEL task; for more detail please see Appendix Section C.1.

### B.3 Mediators

**Happy** Study 5 immediately after the randomization of treatment, respondents were asked about their happiness *only* developed from an emotion scale by Harmon-Jones, Bas-  
tian and Harmon-Jones (2016). We specifically focus on the measurement of respondent  
emotion *in the moment*, so as to avoid conflating emotions across the experience of the  
overall survey with the emotions related to the treatment. Below is the phrasing of the

happiness measure:

This scale consists of a number of words that describe feelings and emotions. Read each item and then mark the appropriate answer in the space next to the word. Indicate to what extent you feel this way RIGHT NOW.

**scale: very slightly or not at all/ a little/ moderately/ quite a bit/ extremely**

**emotions: happy/enjoyment/liking**

## B.4 Attention checks

Given concerns of greater online fatigue and inattentiveness during the COVID-19 global pandemic (see Peyton, Huber & Coppock, Working paper 2020), we follow Peyton et al.'s work, and the work of others on the usage of attention checks in online surveys (see for example Berinsky et al. (2019)), and incorporate two pre-treatment attention check questions for Studies 4, 5A and 5B. The first attention check is styled in a multiple choice and the second via a grid question (see Figures B.2-B.3) to capture most attentive respondents as well as least Berinsky et al. (2019). The multiple choice (attentionMC) and screening questions in the grid (attentionG) are drawn directly from Berinsky et al. (2019), while the filler questions in the grid are designed to elicit non-politically oriented opinions from respondents so as to minimize possible priming effects downstream.

## B.5 Respondent covariates

Each study asked a series of respondent-level covariates within the surveys; for ease we present information on the collection and timing of each of respondent covariates across studies in Table B.2.

# C Task descriptions

## C.1 Main choice task

The main choice task that appears throughout Studies 1, 3, 4 and 5, entails a practice round, where respondents practice both FEEL and DESCRIBE activities. We describe the practice and main task below. For the practice, main task (and reservation wage task) images are drawn from the **Faces Data** in Chicago Faces and Harvard Faces Databases, randomized among the following features: Race=Black/White, Gender=Male (no variation), Valence=Angry/Fearful; images are randomized *without replacement* within respondent. See Figure C.8 for example draws of faces.

**Practice Trial** All respondents complete a practice trial after pretreatment covariates are collected and before the main randomization (praise).

We are interested in what sections people like to read in the newspaper. This might affect what they learn from articles and how they feel about the issues discussed in them. We also want to see if people are reading the questions carefully. To show that you've read this much, please mark both the classified and none of the above options below. That's right, just select these two options only.

Regardless of how frequently you read the newspaper, what would you say are your favorite newspaper sections to read? (please check all that apply)

All of the above

Figure B.2: MC attention check

In the following, you will complete a task. You will first complete a practice trial, which will help you become familiar with the task. After the practice trial.

On the trial, you will see two decks of shuffled cards: the deck on the left will always be labeled DESCRIBE and the deck on the right will always be labeled FEEL. You should choose between these

In the grid below, you will see a series of statements. Please tell us whether you agree or disagree with each statement.

	Agree strongly	Agree	Neither agree nor disagree	Disagree	Disagree strongly

decks. Once you choose a deck, you will then see an image of a person. The decks include the same images. Depending on which deck you have chosen, you will be given one of two possible sets

Figure C.4: Race=Black, Valence=Angry

Figure C.5: Race=Black, Valence=Fearful

Figure C.6: Race=White, Valence=Angry

Figure C.7: Race=White, Valence=Fearful

#### Figure C.8: Example faces from Chicago Faces Database.

of instructions.

If you choose from the deck labeled DESCRIBE, you will be told to be objective and focus on the external features and appearances of the person in the image. When completing this kind of trial, try to be as objective as possible. To be objective, do not let yourself get caught up in imagining what this person feels. On these trials, describe the **age**, **gender** and **race** of the person.

If you choose from the deck labeled FEEL, you will be told to have empathy and focus on the internal feelings and experiences of the person in the image. When completing this kind of trial, try to feel as much empathy as possible. To be empathetic, let yourself get caught up in imagining what this person feels. On these trials, describe the **feelings** and **experiences** of the person.

You are free to choose from either deck on any trial, and should feel free to move from one deck to the other whenever you choose. If one deck begins to seem preferable, feel free to choose that deck more often. Overall, this task will take the same amount of time regardless of which deck you choose.

Now you will complete a practice trial of the task; later on, you will turn over to the task.

Please click on one of the decks.

[Depending on what respondent clicks first, rotate questions below]

[Deck chosen is highlighted; image is presented.]

FEEL

1. Please write a sentence describing the **feelings** and **experiences**

of this person. [Open-ended sentence. Cannot proceed without writing, min time 10 seconds.]

2. Please write three words that describe the **feelings** and **experiences** of this person. [Three open-ended slots. Cannot proceed without writing in all slots, min time 10 seconds.]
3. How do you feel about this person? [Feeling thermometer]

Please click on the other deck. [Forced choice]

[Other deck is highlighted; image is presented]

#### DESCRIBE

1. Please write a sentence describing the **age** , **gender** and **race** of this person. [Open-ended sentence. Cannot proceed without writing, min time 10 seconds.]
2. Please write three words that describe the **age** , **gender** and **race** of this person. [Three open-ended slots. Cannot proceed without writing in all slots, min time 10 seconds.]
3. How do you feel about this person? [Feeling thermometer]

**Main task** After the practice round, respondents enter into the main task (with or without treatment praise, depending on the Study).

In the following trial, you will repeat the task you did in the practice round, where you will be asked to choose the deck you prefer each time, presented with a person in an image, and then asked to answer questions related to the deck you chose.

**Recall:** You are free to choose from either deck.

1. [Present two labeled decks; do not allow any clicking until after the treatment is drawn.]
2. Then print on the page: Please click on one of the decks.
3. [Deck chosen is highlighted; image is presented.]
4. [Provide trial questions based on whichever deck is selected by the respondent.]

## C.2 Reservation wage task description

In the next task, you will be making choices between real amounts of money. You will see several choices to make between the two decks of cards, exactly like the tasks you completed earlier.

For each choice between the decks, the DESCRIBE deck asks you to be objective and write about the age and race of a person, and the FEEL deck asks you to be empathetic and write about the internal experiences and feelings of a person. In all cases, the persons shown faces similar to those you saw earlier in the experiment. This time, you will see a real payment for completing a trial from each deck, for each choice. Please select the option that you prefer for each of the choices. There are no accurate or inaccurate answers. A random draw from one of the sets of choices will be enacted, and you will be directed to the deck you chose under that choice set, and paid the amount for that choice. These choices are thus **real decisions with real pay**.

[Present list of paired options of decks for respondent to click on.]

Wages for DESCRIBE are always \$1.00; wages for FEEL range from \$0.99 to \$1.13 in 1 cent increments. Each time an option for a pair is clicked on, the respondent will see the sentence below the pair “I would prefer to conduct task DESCRIBE/FEEL for Y amount, over task FEEL/DESCRIBE for Z amount.”

Recall your preferred choices for wages for DESCRIBE and FEEL.

[Randomly assign one of the paired options in the **Real Wage Task** to execute. Highlight the selected row.]

A random draw of the paired choices you have made has been selected: you will now conduct task X for Y amount. Your Y pay will be added to your survey pay at the end of this survey.

## D Study 1: Costs of Empathy

Study 1 was fielded in September 2020, with a total of 318 respondents. The purpose of the study was to establish the baseline costliness of empathy. Figure D.9 presents the consort diagram for Study 1. Descriptive statistics on respondent covariates are presented in Table D.3. Respondents were also asked about their beliefs on how often other respondents on the platform chose the FEEL and DESCRIBE tasks, and what they thought others' beliefs about empathy and objectivity were (see Table D.4). Other than measuring respondents' behavioral choices to establish baseline costs of empathy, we also directly asked respondents to rate the FEEL and DESCRIBE tasks for difficulty using the NASA task load; summary statistics for answers to these questions are presented in Table D.5 and differences between the answers by task type are in Table D.6.

Figure D.10: Attrition across survey questions.

## Study 1 Attrition

## E Study 2: Eliciting Naturalistic Praise (non-experimental)

Study 2 was fielded in September 2020 with a total of 115 respondents. The purpose of the study was to elicit naturalistic peer praise for the empathy and objective tasks. The consort diagram for Study 2 is presented in Figure E.11. Table E.7 presents respondent covariate descriptives from the study. No attrition occurred in the study. Respondents were asked to write sentences and words that would praise peers who engaged in empathetic/objective behavior due to doing the FEEL and DESCRIBE tasks. Figure ?? presents a plot of the words that occur differentially across the words elicited for praising FEEL and DESCRIBE.

Table E.7: **Study 2 Respondents.** Total number of respondents 115.

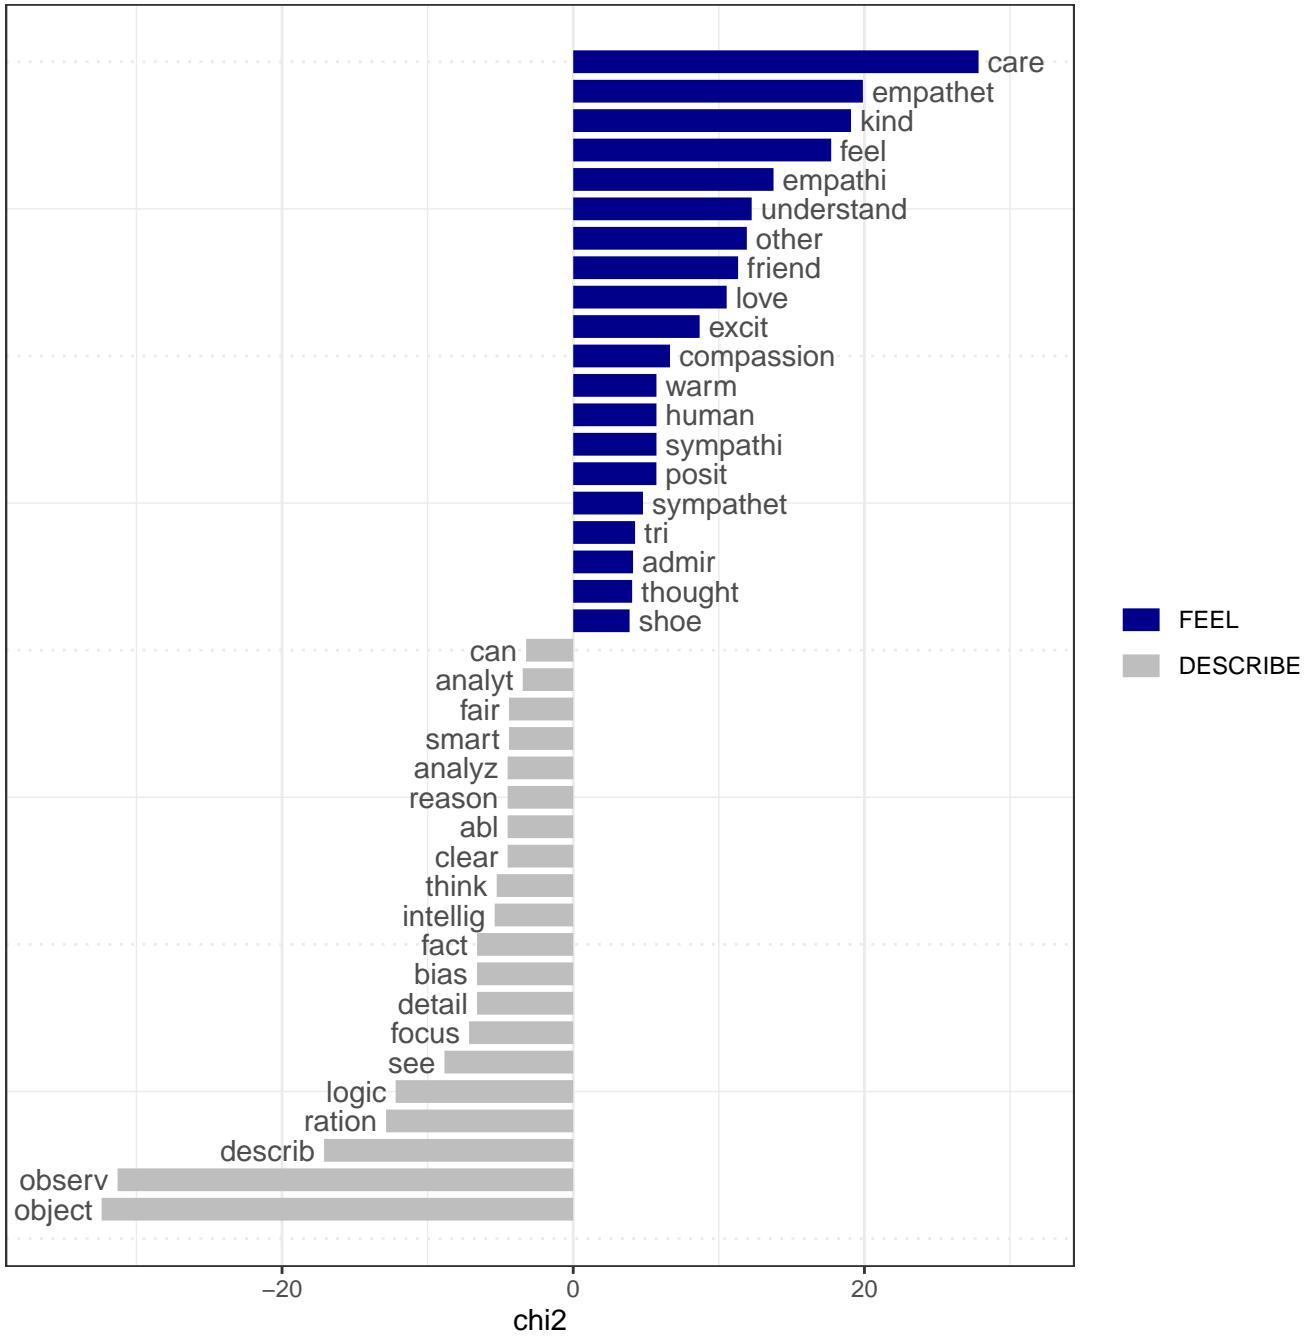

Figure E.12: **Keyness plot of words for empathy (FEEL) versus objective (DESCRIBE) tasks.** Figure plots the results of a keyword of features comparing their differential associations with providing language in praise of peers who engage in empathy (FEEL) versus objective (DESCRIBE) tasks, after calculating “keyness”, a score for features that occur differentially across different categories. Here text for (FEEL) and (DESCRIBE) are the different categories.

As a further check on whether positive feelings are held towards people who exhibit empathetic or observational behaviors, we asked respondents to provide thermometer ratings towards people who exhibited these types of behaviors. We calculate the positive and negative sentiments for praise texts respondents generated for people who display empathetic

and objective behaviors respectively, using the Lexicoder Sentiment Dictionary and verify whether the thermometer ratings are positively correlated with positive text sentiments and negatively correlated with negative text sentiments. Figures E.13 and E.14 present linear association results that suggest the same.

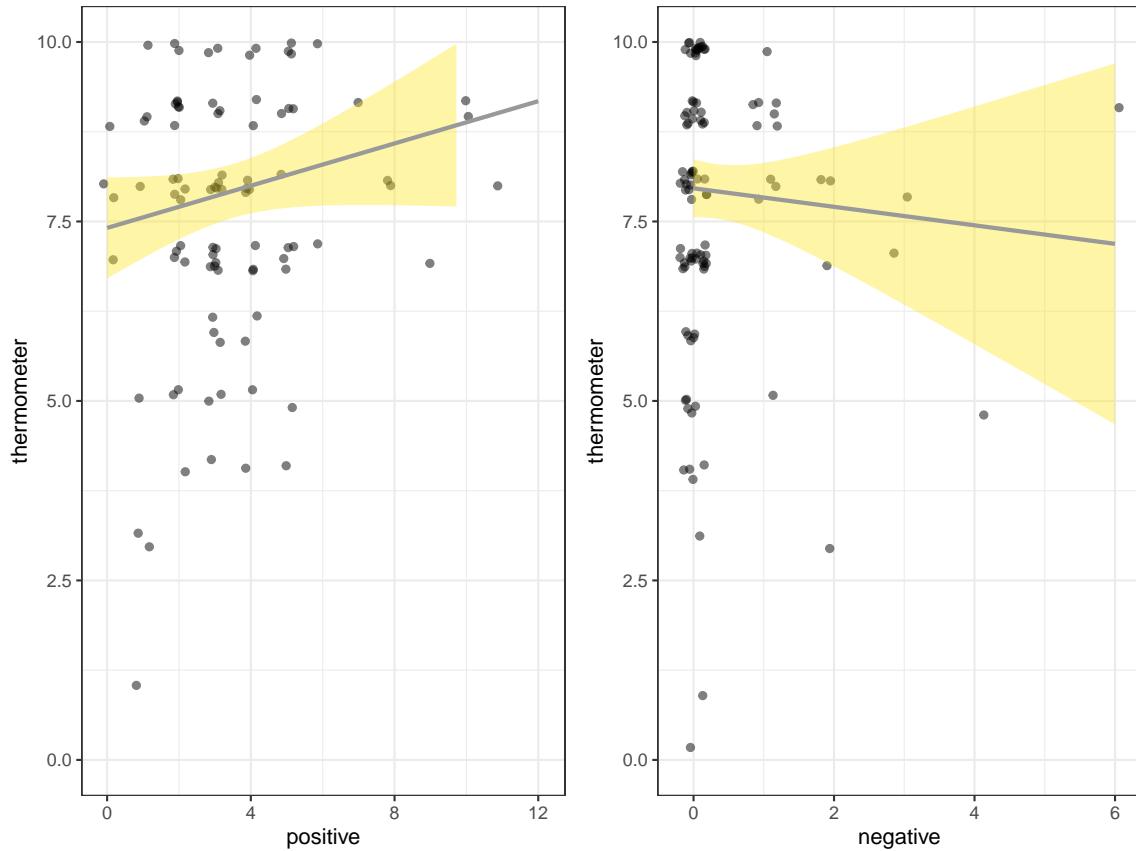

Figure E.13: Correlation between positive and negative text sentiments for generated texts of praise for empathetic behavior with thermometer ratings for people who engage in empathetic behavior.

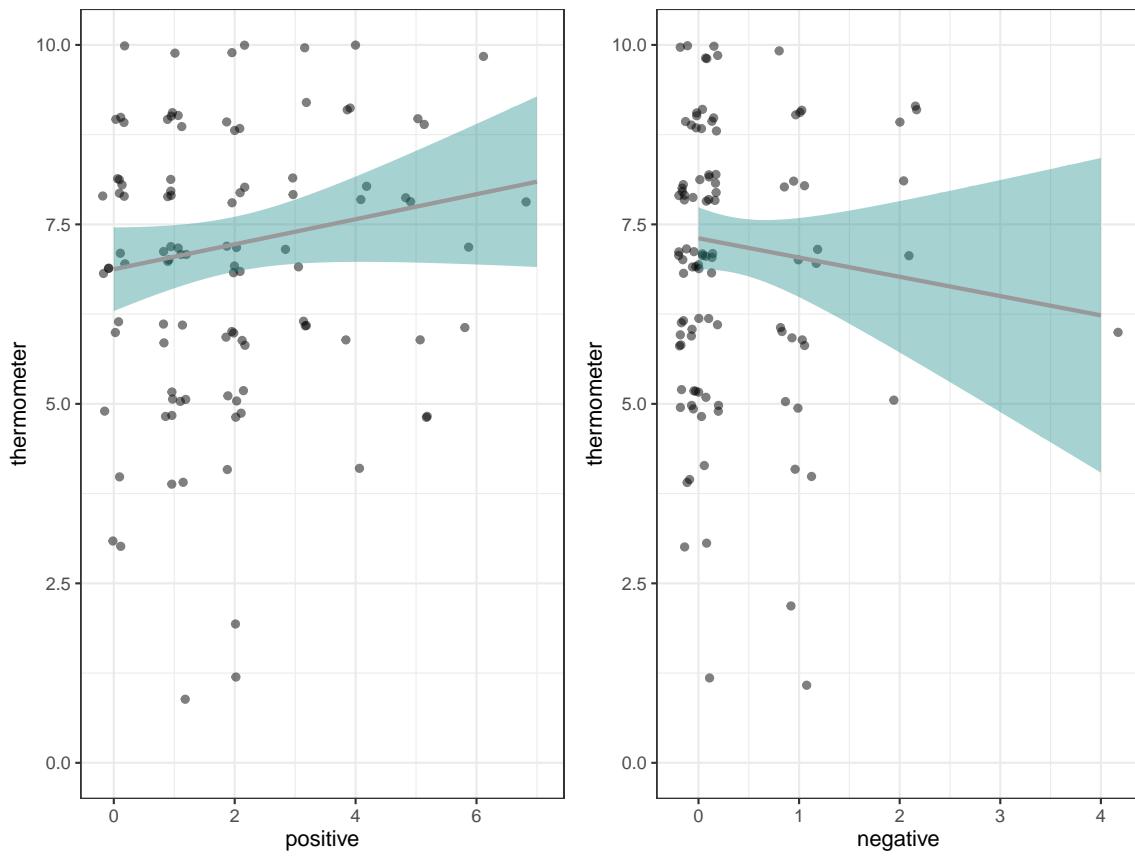

Figure E.14: Correlation between positive and negative text sentiments for generated texts of praise for objective behavior with thermometer ratings for people who engage in objective behavior.

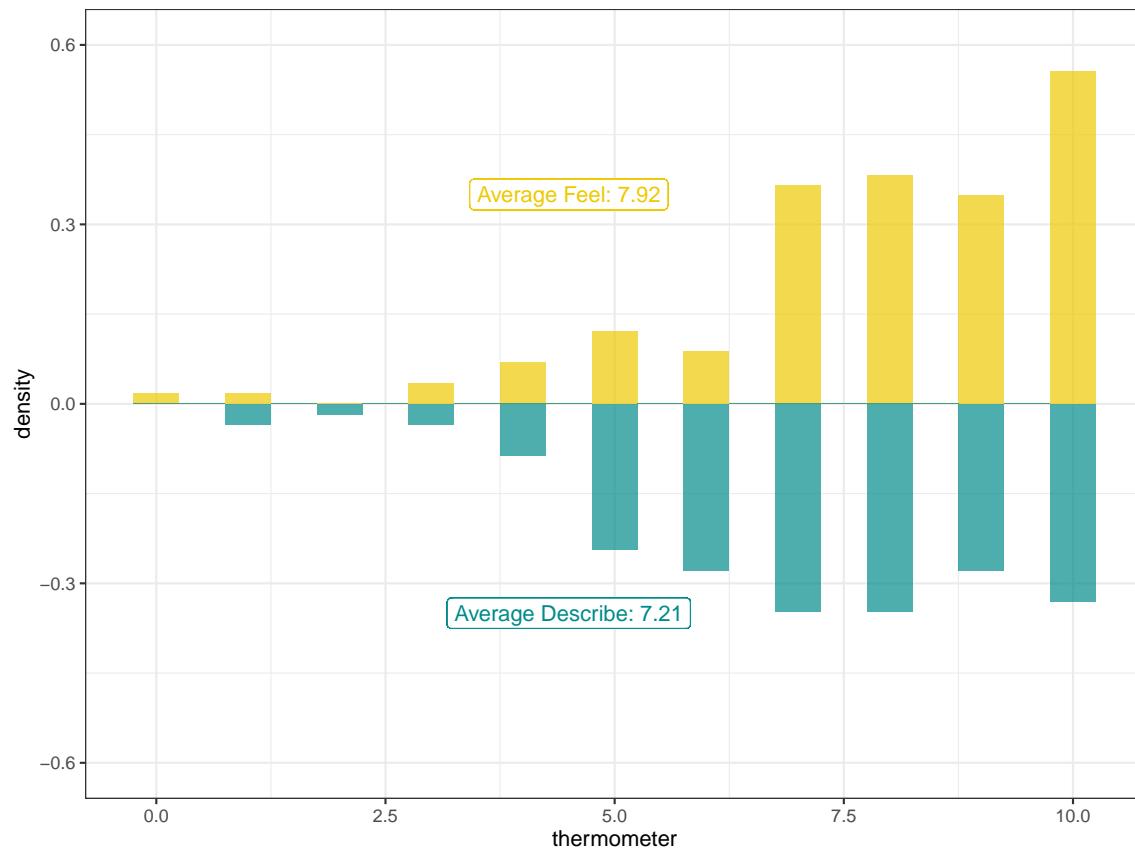

Figure E.15: Distributions of thermometer ratings towards peers who exhibit empathetic behavior (top) and towards peers who exhibit objective behavior (bottom).

## Study 2 Attrition

## **F Study 3: Praise Lowers the Cost of Empathy**

Study 3 was fielded in November 2020 with 328 respondents. The primary purpose of the study was to establish whether peer praise (for empathy) could encourage empathetic behavior. We randomized peer praise for empathetic behavior, peer praise for objective behavior (taken from Study 2) and a control arm of no intervention and measured respondents' choice of task between FEEL and DESCRIBE. Secondarily, we were interested in evaluating whether peer praise might change reservation wages for the FEEL task. Figure F.16 depicts the consort diagram for Study 3.

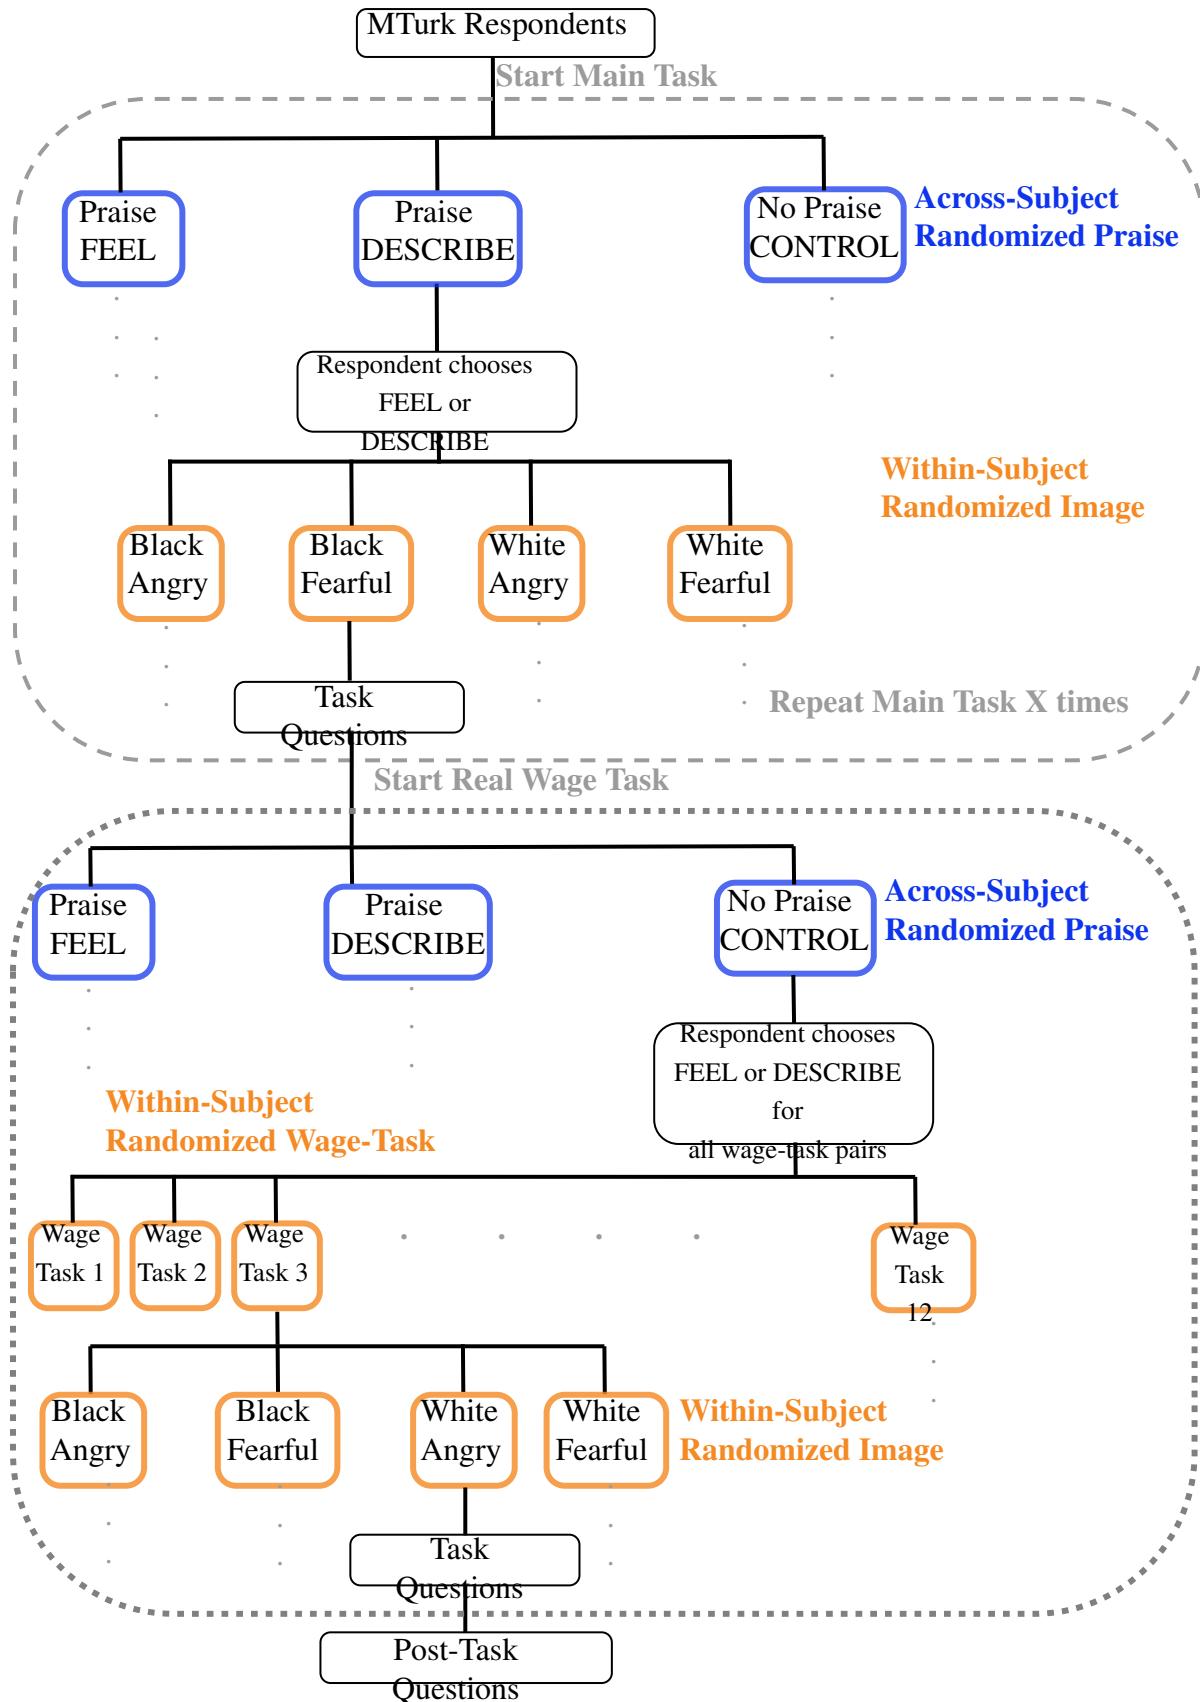

Figure F.16: Study 3 Consort Diagram

	<b>Log Odds</b>	<b>95% CI</b>	<b>Odds Ratio</b>	<b>95% CI</b>
<b>Intercept</b>	-0.442	[-0.625,-0.259]	0.643	[0.535,0.772]
<b>Peer praise for empathy</b>	0.182	[0.025,0.339]	1.200	[1.025,1.404]

Table F.8: Peer praise effect on task choice.

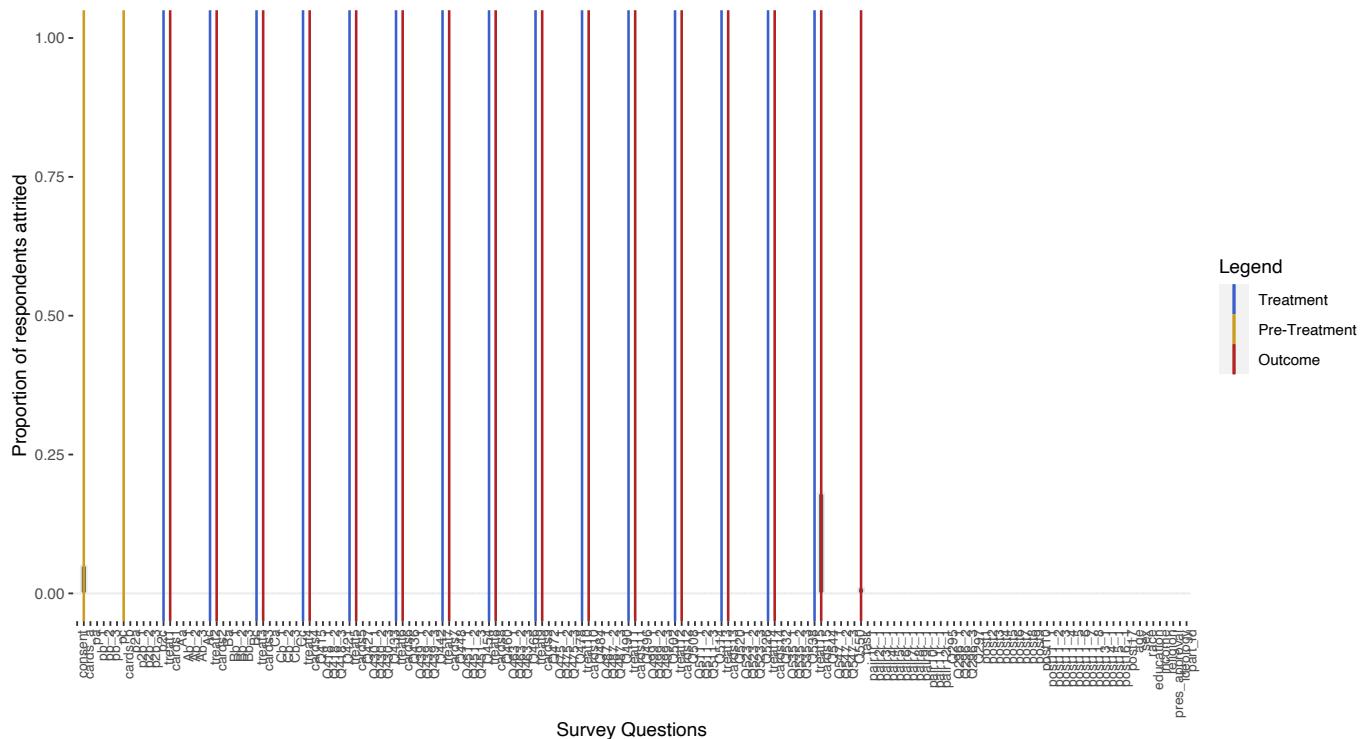

Figure F.17: Attrition across survey questions:

**Study 3 Attrition** A total of 75 attrited from the survey. Of those, 18.7% attrited during the first set of instructions, 34.7% attrited during the practice round, and 21.3% attrited during the post task questions. Attrition is not associated with praise treatment, or randomization of images. Respondents who were primed with praise FEEL, were 0.5% less likely to attrite (baseline is 0.01) than compared to respondents who received the Control (no praise). This finding is not statistically significant ( $p = 0.1$ ). Respondents who saw an image with a black person, were 1.8% less likely to attrite (baseline is 0.55) than compared to respondents who received an image with a white person. This finding is not statistically significant ( $p = 0.4$ ). Respondents who saw an image with an angry person, were 0.4% less likely to attrite (baseline is 0.517) than compared to respondents who received an image with a fearful person. This finding is not statistically significant ( $p = 0.8$ ).

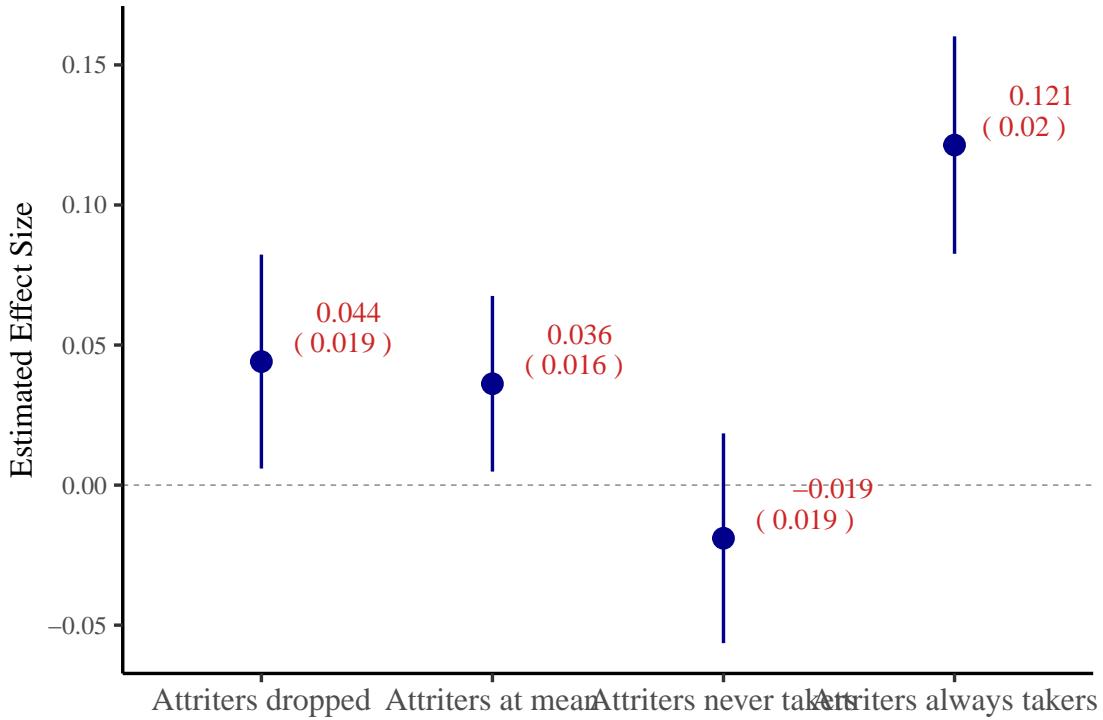

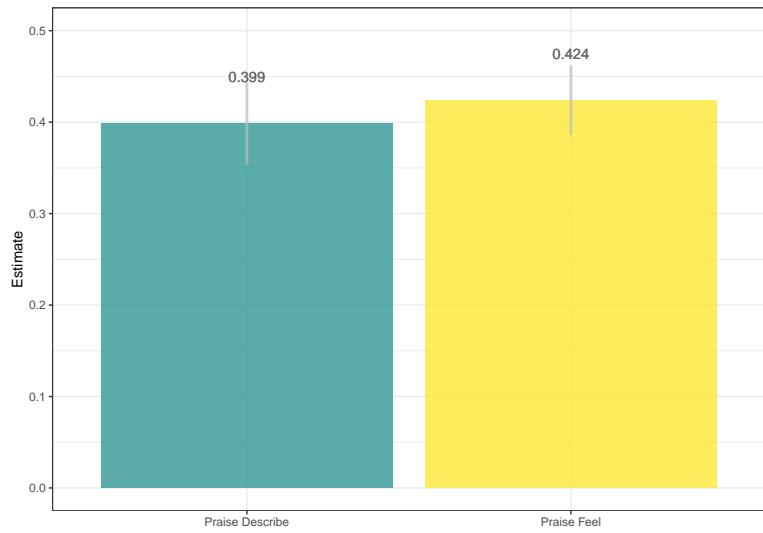

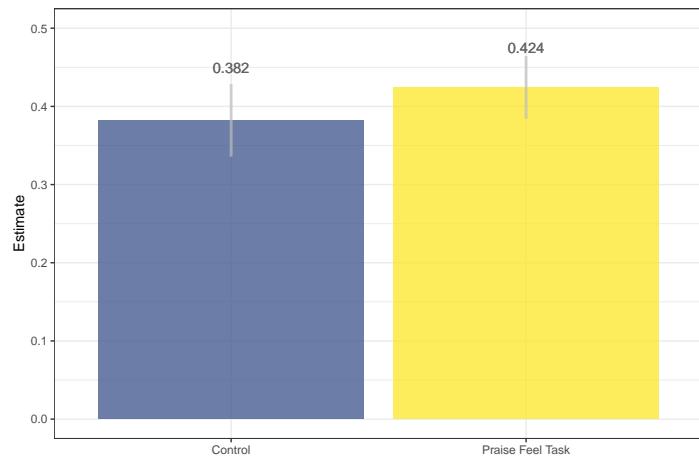

Figure F.18: **Missingness Imputed:** In all models, ‘describeORfeel’ is regressed over ‘PraiseEmpathy’, estimating the effect of praise FEEL on selecting to perform task FEEL. Attritors dropped is the main model presented in the paper, in which attritors are dropped from the analysis. Attritors at mean is coded such that attritors receive the mean value for ‘describeORfeel’. Attritors never takers is coded such that attritors never take the praise treatment. Thus, ‘describeORfeel’ receives the value 0 (DESCRIBE) when attrited respondents are treated with praise FEEL. Otherwise, attrited respondents receive a value selected from a distribution around the mean of controlled respondents. Attritors always takers is coded such that attritors always take the praise treatment. Thus, ‘describeORfeel’ receives the value 1 (FEEL) when attrited respondents are treated with praise FEEL. Otherwise, attrited respondents receive a value selected from a distribution around the mean of controlled respondents.

We comparing peer praise for objective behavior vs peer praise for empathetic behavior on the willingness for respondents to choose the FEEL task in Figure ??; in Figure ?? we check if peer praise for empathetic behavior can reduce the reservation wage for the FEEL task.

**Figure F.19: Effects of Praise for objective behavior on choosing FEEL over DESCRIBE task compared with the Praise for empathetic behavior.** Standard errors clustered at the respondent level. Difference in means is 0.026 with standard error 0.019.

**Figure F.20: Effects of Praise for empathetic behavior on the reservation wage for the FEEL task compared with Control arm.** Difference in means is  $-0.03$  with standard error 0.027.

## **G Study 4: Peer praise increases reported happiness**

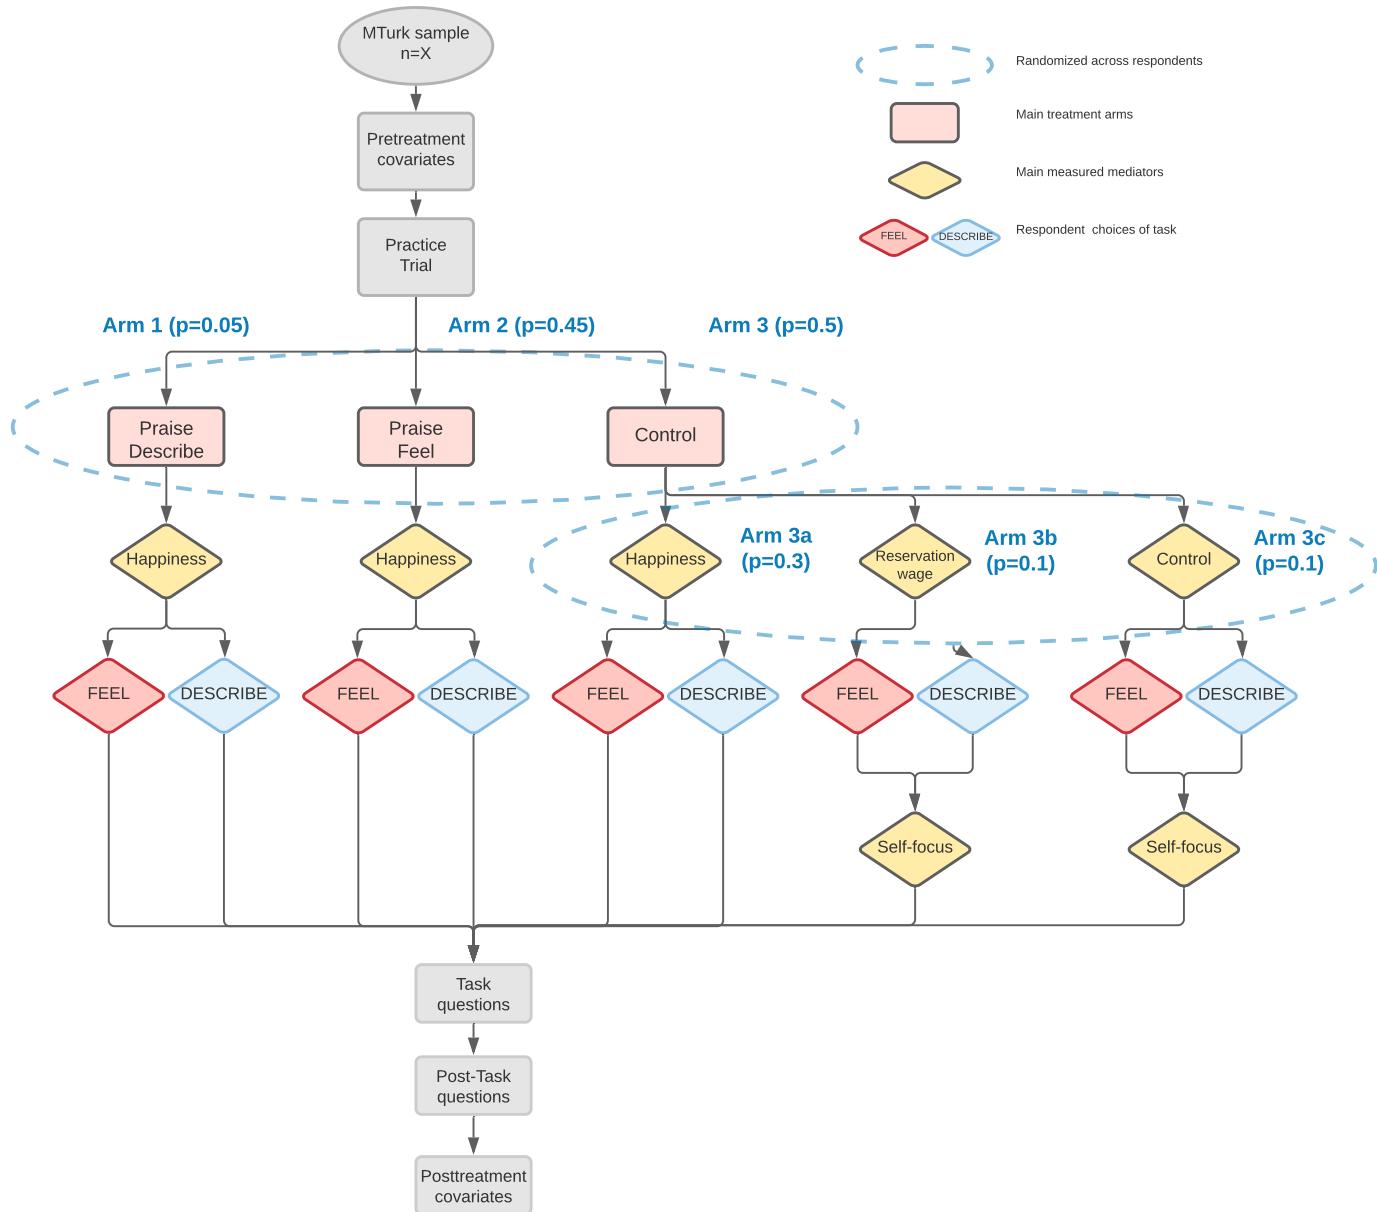

Figure G.21: **Study 4 Consort diagram**. Main arms labeled with probability of assignment in parentheses (probability out of total assignment).

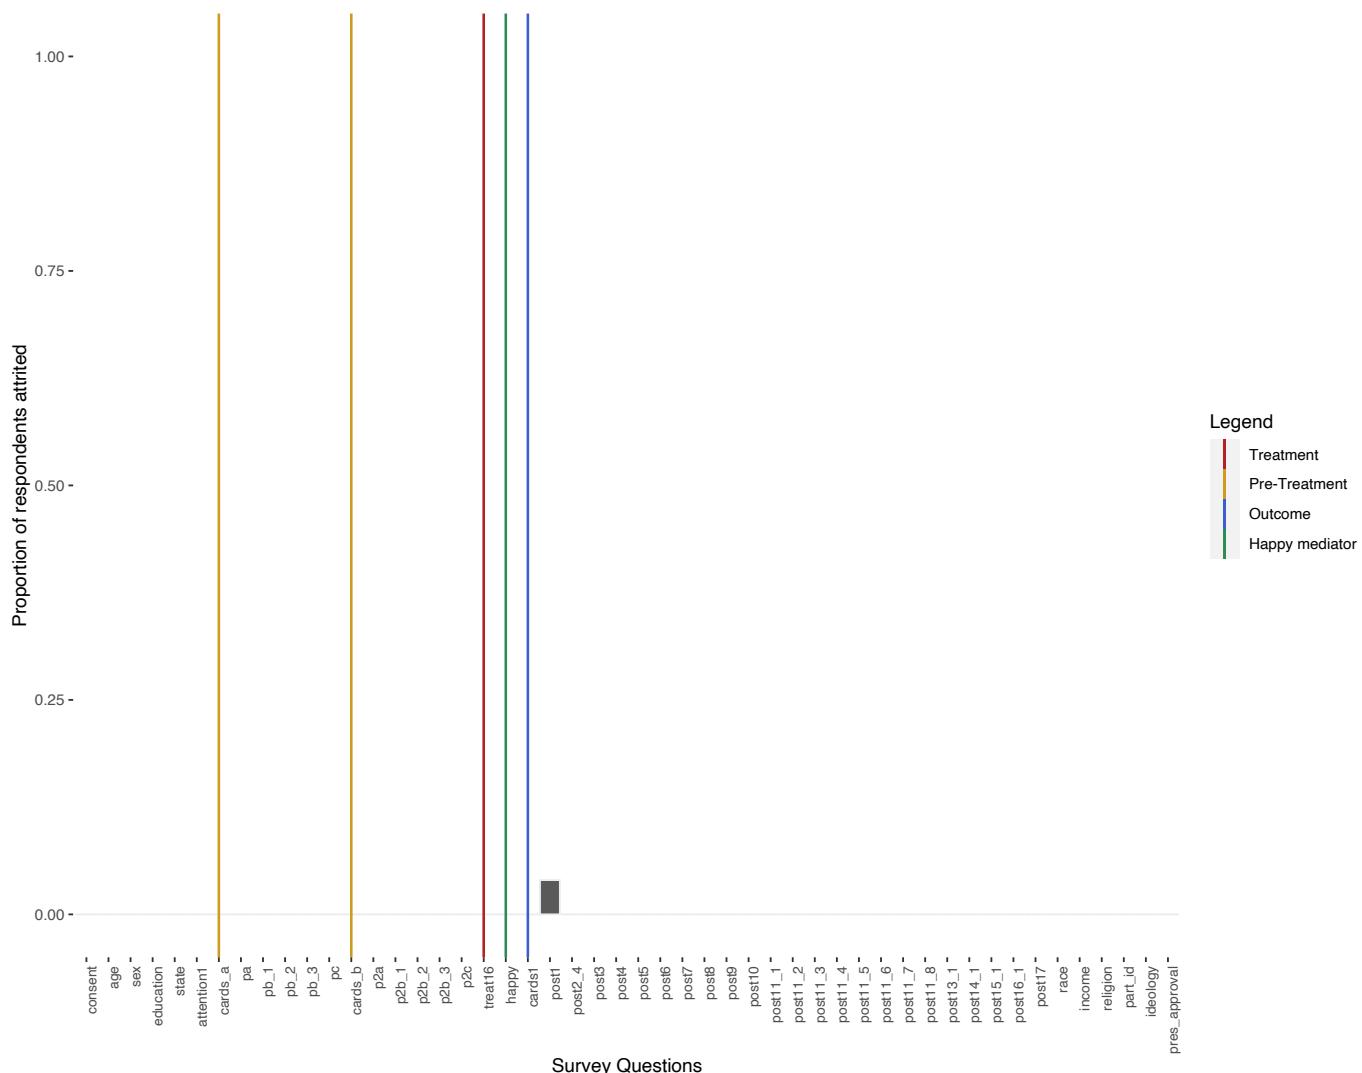

Figure G.22: Attrition across survey questions.

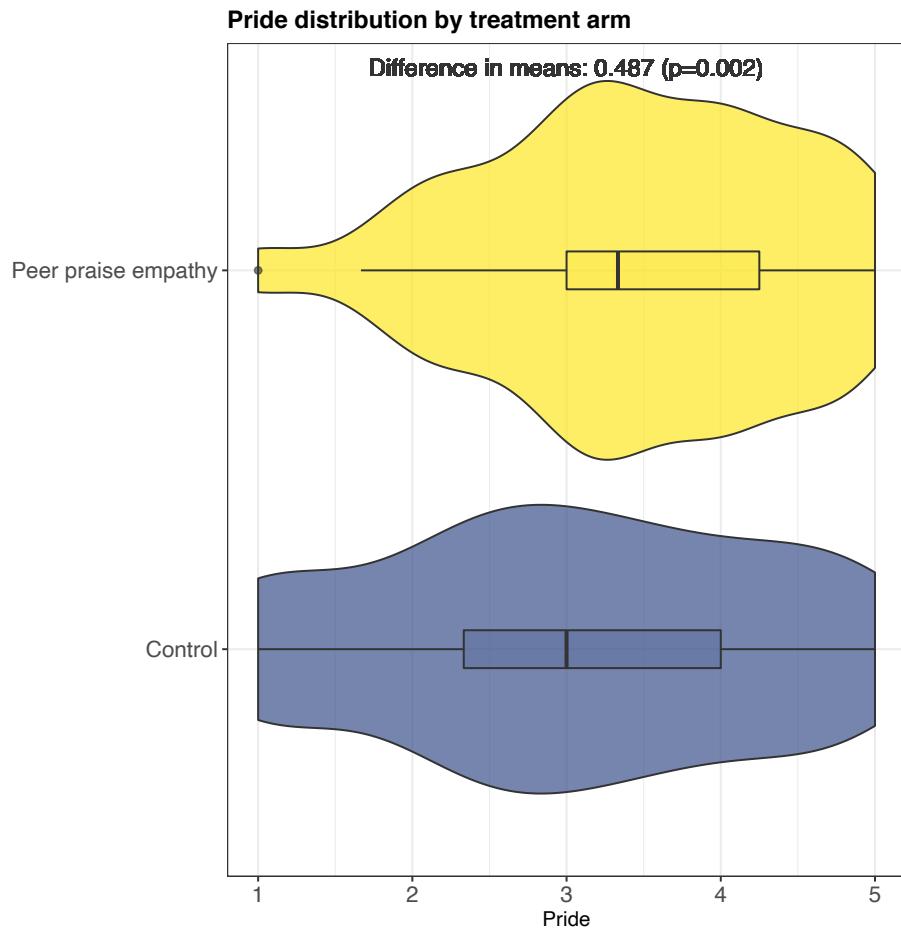

Figure G.23: Pride of respondents in peer praise (for empathy) and control groups.

#### Study 4 Attrition

## H Study 5: Peer praise increases likelihood of empathy task through increased happiness

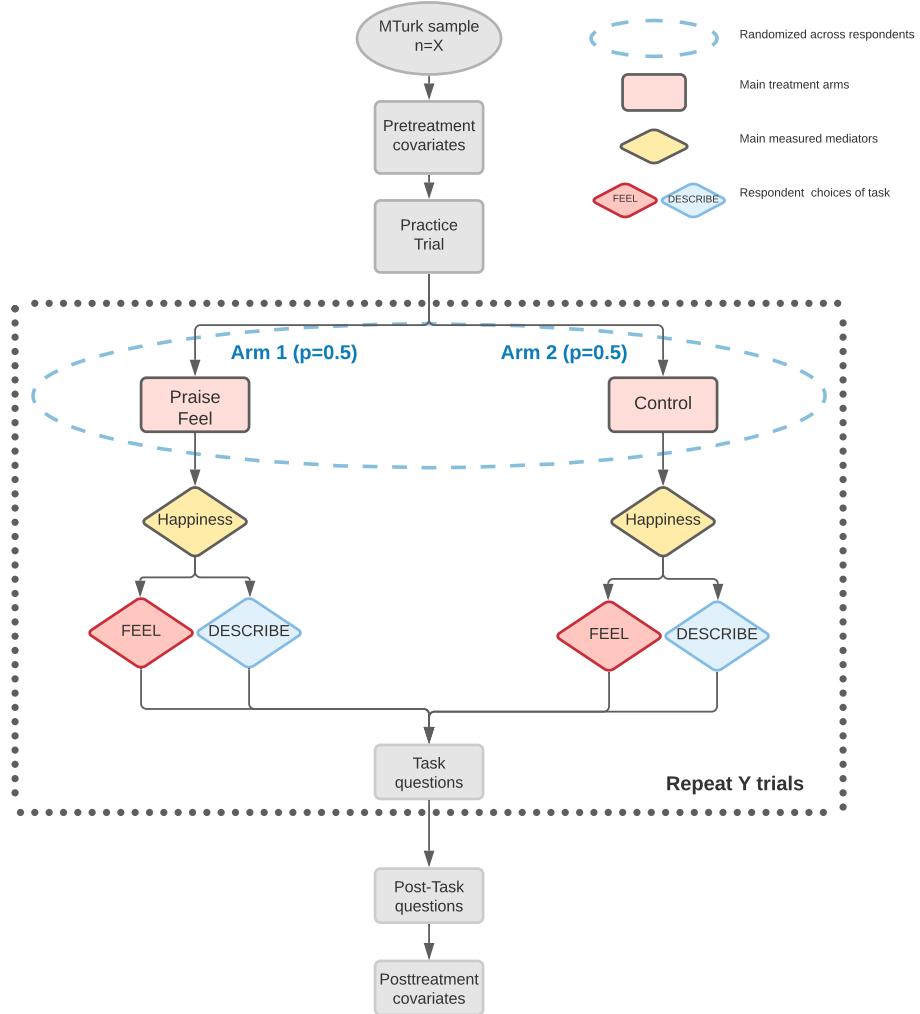

Figure H.24: **Study 5 Consort diagram.** Main arms labeled with probability of assignment in parentheses (probability out of total assignment). Dotted gray space encapsulates the main task, which is repeated for  $Y$  trials for each respondent, where for Study 5A  $Y$  is 20, while for Study 5B  $Y$  is 3.

**Study 5 Attrition** Attrition evaluation plots for 5A and 5B are presented in Figures H.25 and H.26 respectively.

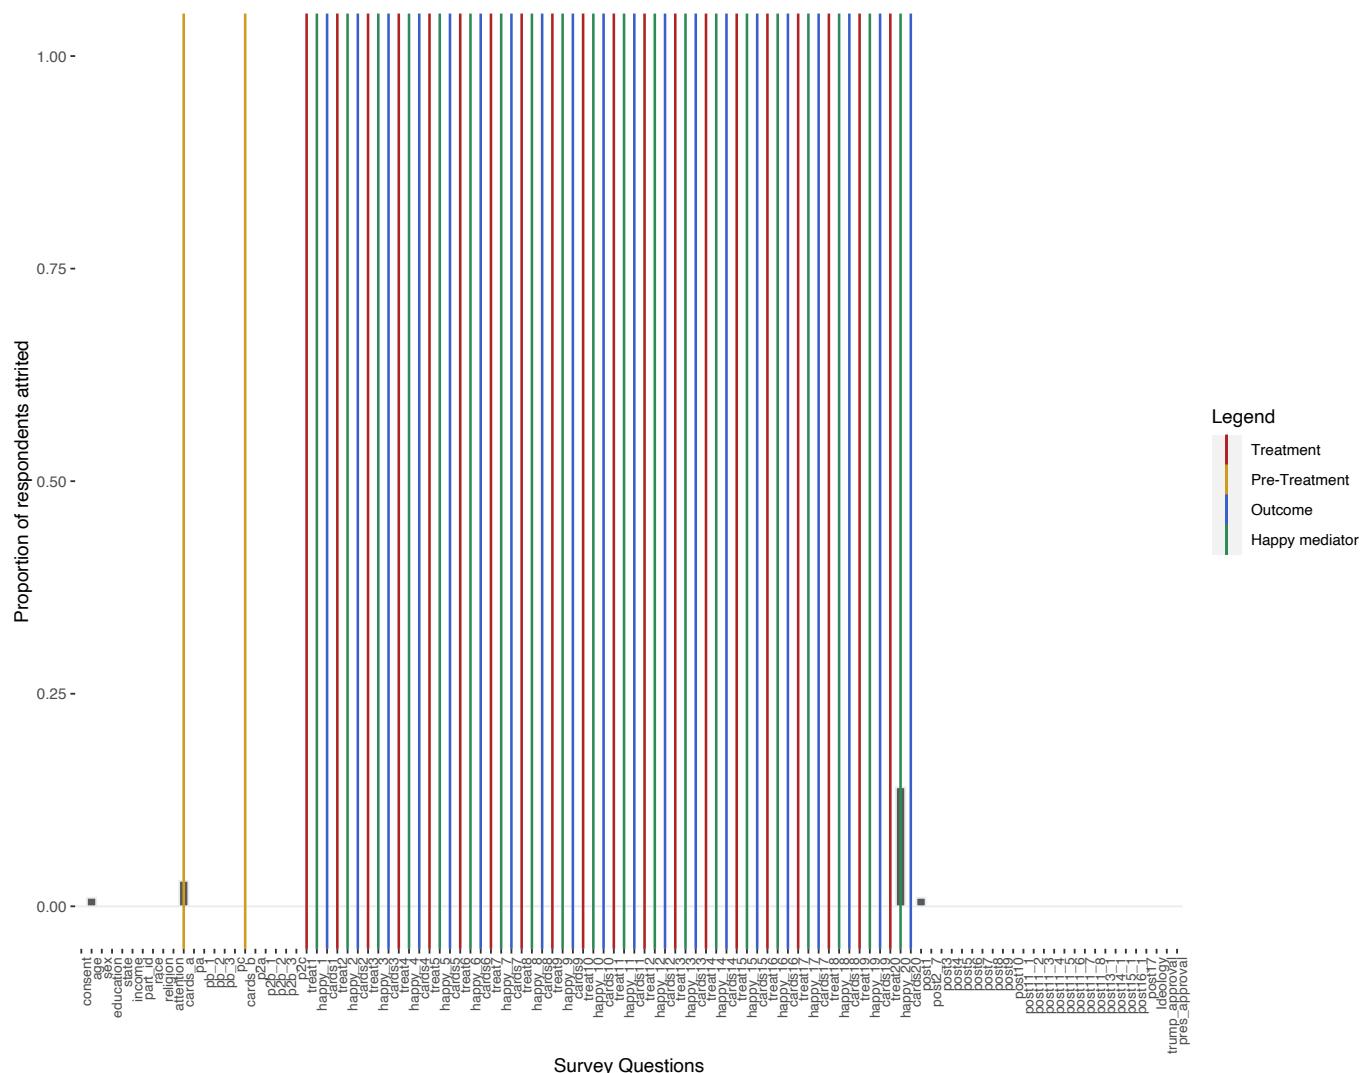

Figure H.25: Study 5A: attrition across survey questions.

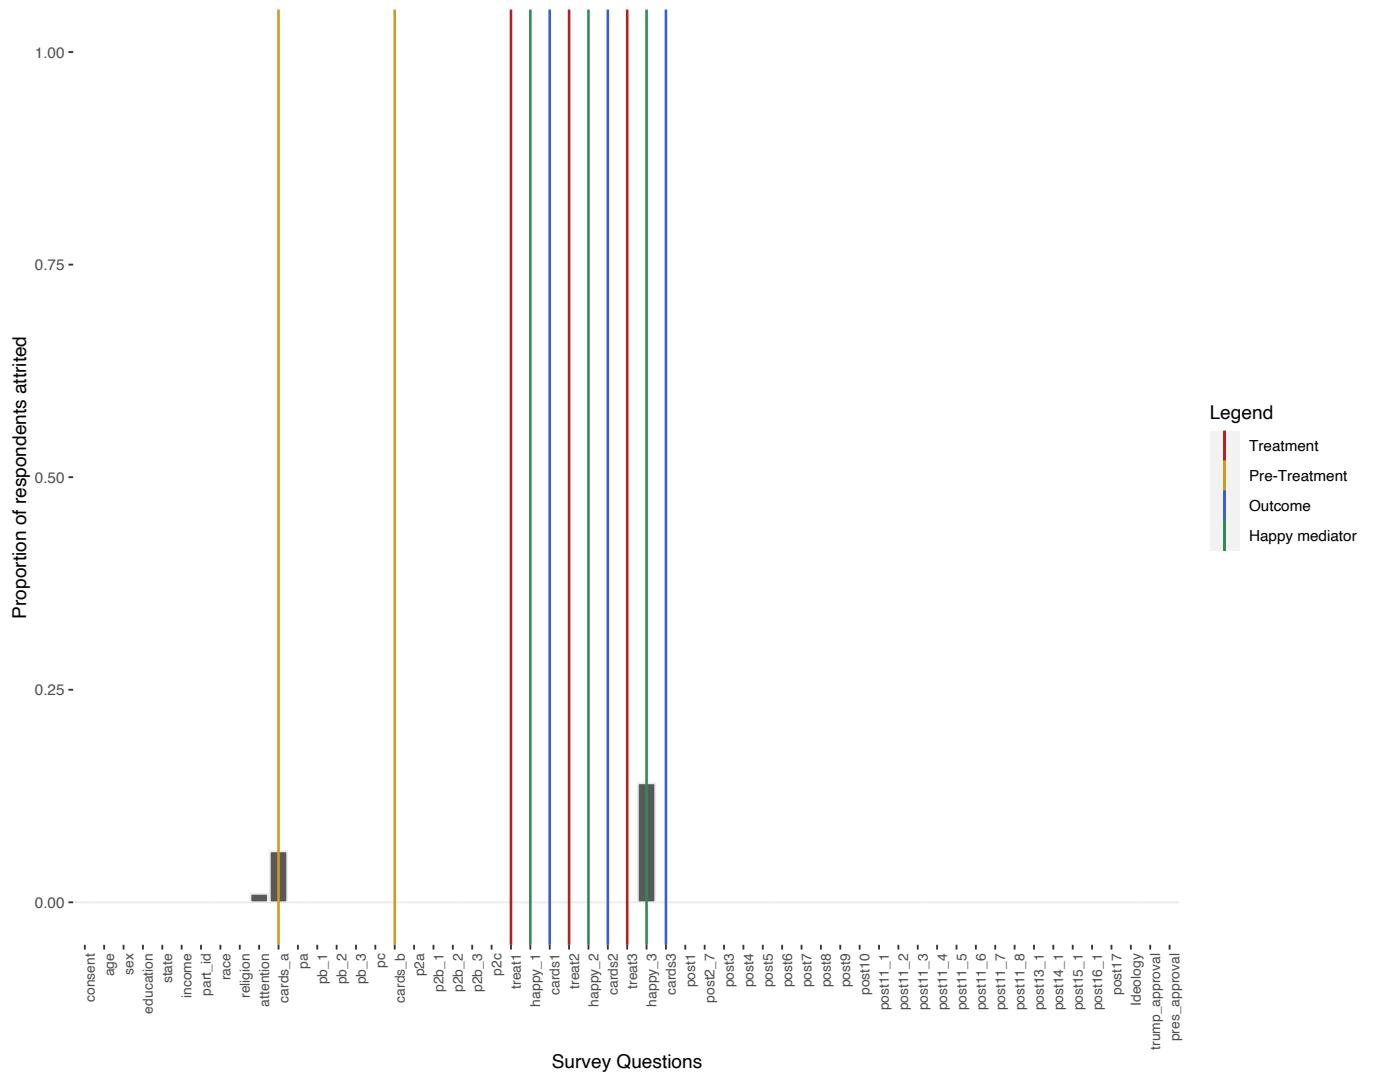

Figure H.26: **Study 5B: attrition across survey questions.**

**Sensitivity analysis of mediation** We analyze the mediating effect of happiness on the choice task variable using Imai, Keele and Yamamoto (2010) approach for model-based causal mediation analysis; the key assumption required is sequential ignorability. Thus we focus on the sensitivity parameter  $\rho \equiv \text{Corr}(\epsilon_{i2}, \epsilon_{i3})$ ; sequential ignorability implies  $\rho = 0$ . We set  $\rho$  at different values and see how our ACME changes for our Study 5 (pooled) sample. This requires the following assumed usual equations relating outcome ( $Y$ ), treatment ( $T$ ) and mediator ( $M$ ) variables:

$$Y_i = \alpha_1 + \beta_1 T_i + \epsilon_{i1} \quad (1)$$

$$M_i = \alpha_2 + \beta_2 T_i + \epsilon_{i2} \quad (2)$$

$$Y_i = \alpha_3 + \beta_3 T_i + \gamma M_i + \epsilon_{i3} \quad (3)$$

We estimate that when  $\rho$  is around 0.12 the ACME becomes 0. Assume the unobserved

(pre-treatment) confounder formulation:

$$\epsilon_{i2} = \lambda_2 U_i + \epsilon'_{i2} \quad (4)$$

and

$$\epsilon_{i3} = \lambda_3 U_i + \epsilon'_{i3} \quad (5)$$

How much does  $U_i$  have to explain for our results to go away? Figure H.27 presents the proportion of original variance explained by  $U_i$ .

We can reparameterize  $\rho$  using  $(\tilde{R}_M^2, \tilde{R}_Y^2)$ :

$$\rho = \frac{\text{sgn}(\lambda_2 \lambda_3) \tilde{R}_M \tilde{R}_Y}{\sqrt{(1 - \tilde{R}_M^2)(1 - \tilde{R}_Y^2)}} \quad (6)$$

where  $R_M^2$  and  $R_Y^2$  are from the original mediator/outcome models. We can set  $(\tilde{R}_M^2, \tilde{R}_Y^2)$  to different values and see how mediation effects change.

Figure H.28 assumes that the confounder influences both the mediator and outcome variables in the same direction.<sup>1</sup> The bold line represents the various combinations of  $R^2$  statistics where the ACME would be 0. In this case the product would have to be 0.014 for the ACME to become 0. Another way to say this is that when the product of the original variance explained by the omitted confounding is 0.014 the point estimate for ACME would be 0.

---

<sup>1</sup>This matters because the sensitivity analysis is in terms of the product of  $R^2$  statistics; we assume positive because it seems more likely that something positively affecting the Mediator and the Outcome is happening to create the positive finding for the ACME).

## Sensitivity Analysis (5 pooled)

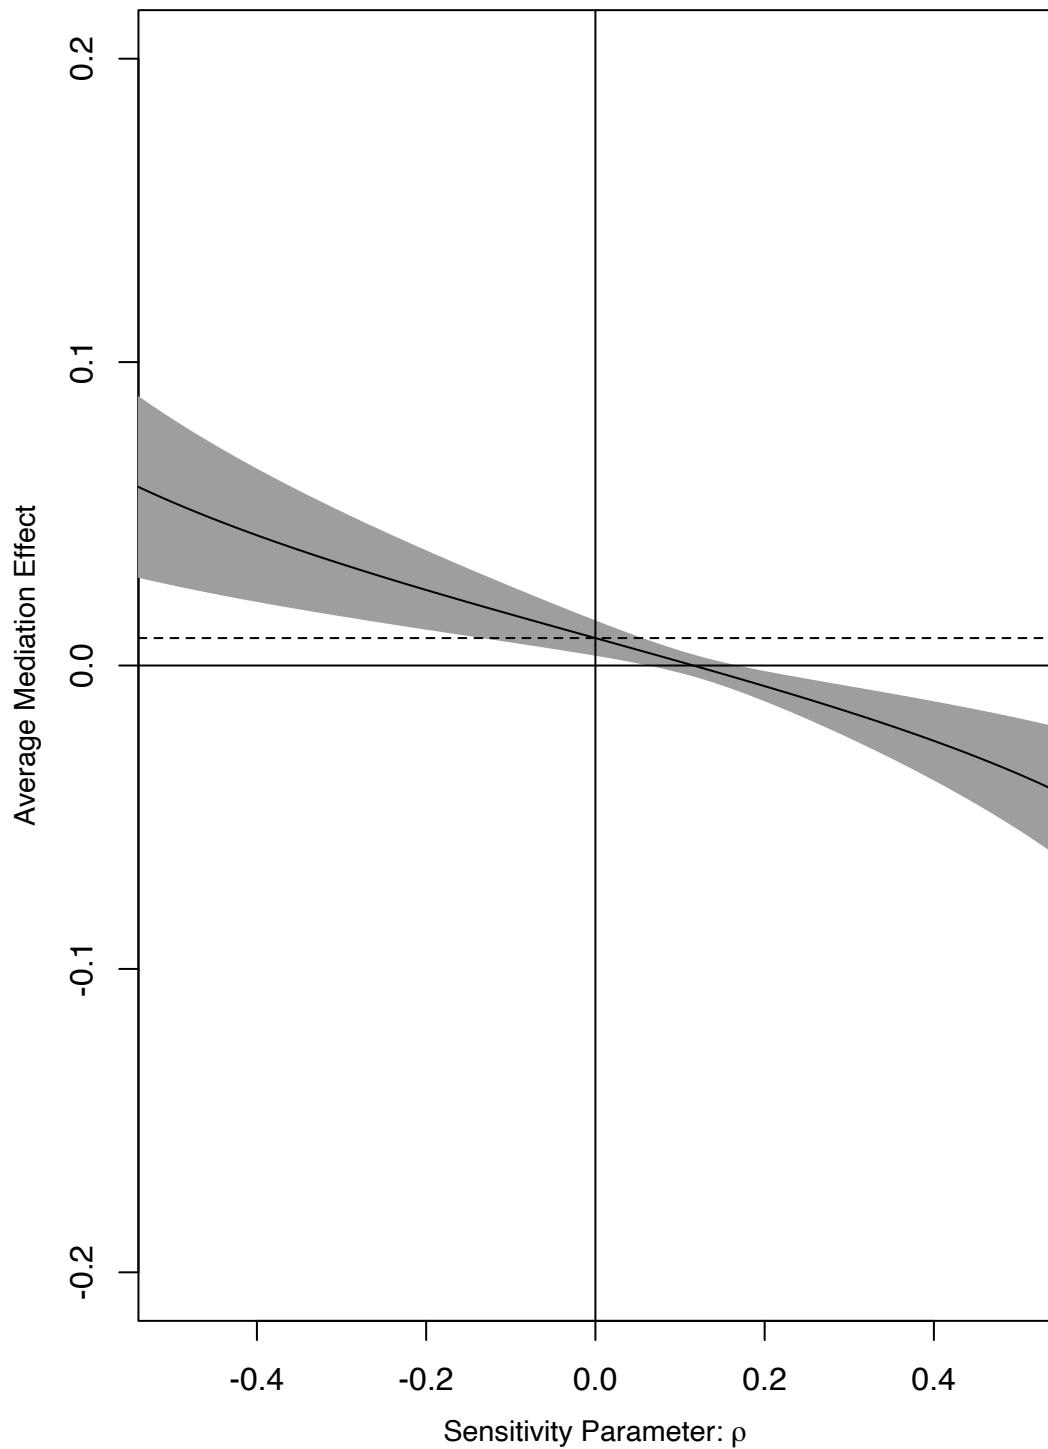

Figure H.27: Proportion of original variance explained by  $U_i$ .

## Sensitivity Analysis (5 pooled)

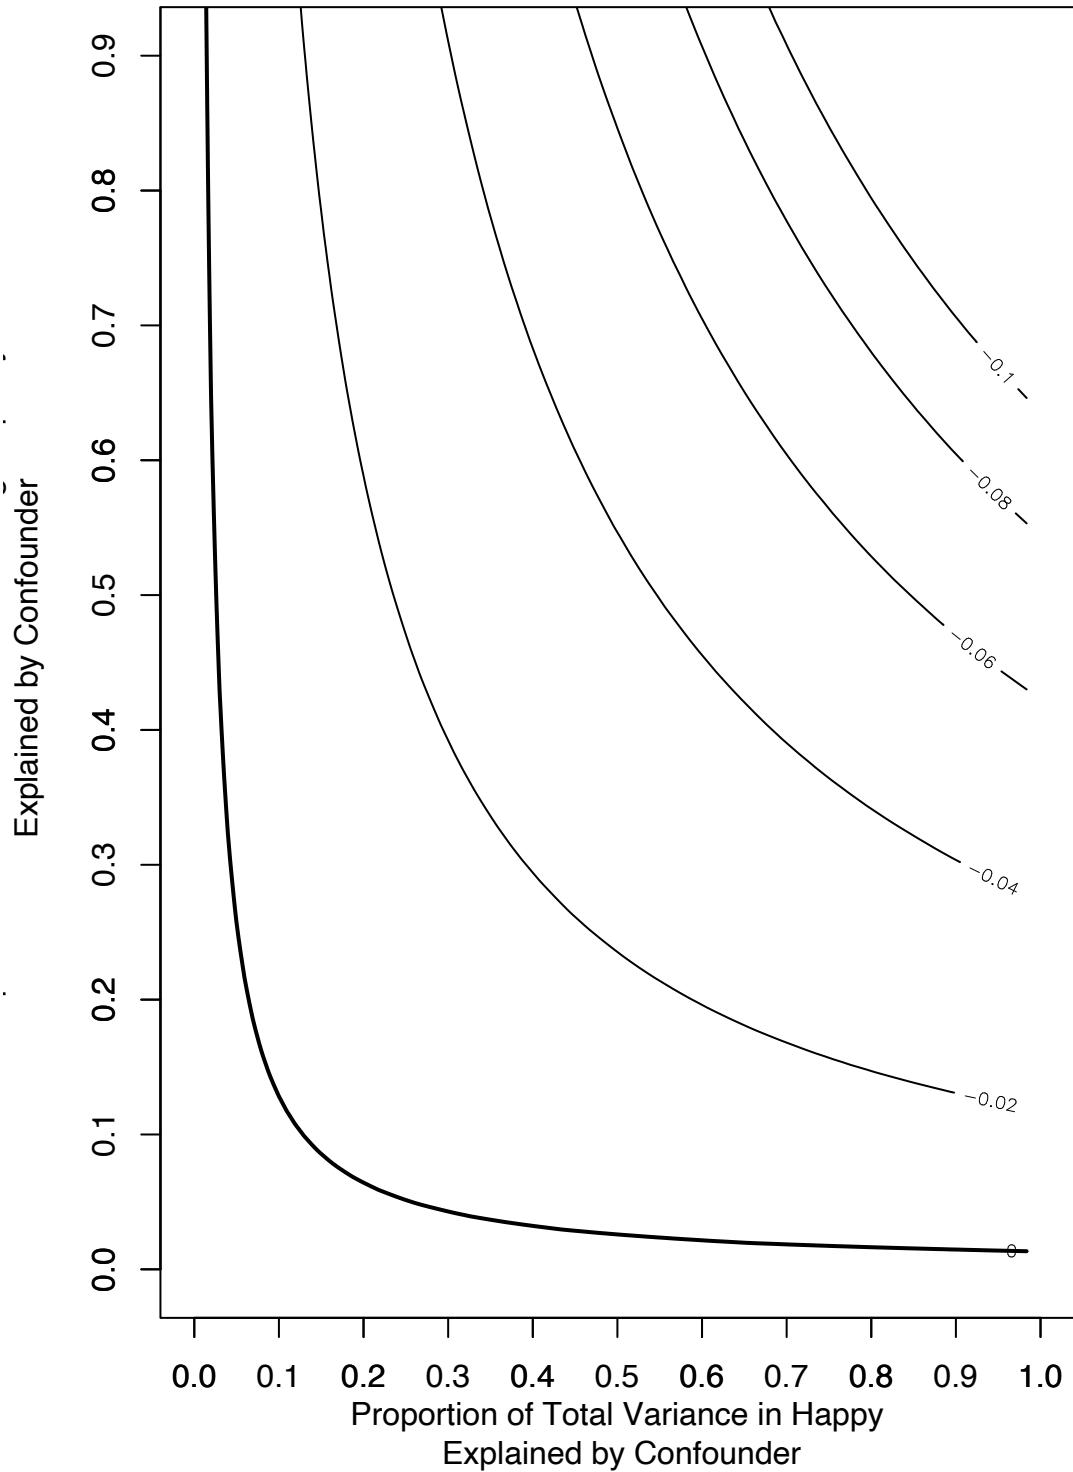

Figure H.28:  $R^2$  statistics for which ACME would be 0.

# I Scope of peer praise for empathy

Estimated standard errors are clustered at respondent levels and robust, and 90 and 95% confidence intervals are plotted throughout.

## I.1 Subgroup analyses

- Party
- Presidential approval
- Race
- Education
- Sex
- Baseline empathy

**by Party** Democrats comprise of respondents who reported themselves as “Lean Democrat”, “Democrat” and “Strong Democrat” while Republicans are respondents who reported themselves as “Lean Republican”, “Republican” and “Strong Republican”; Independents are those who reported themselves as “Independent”.

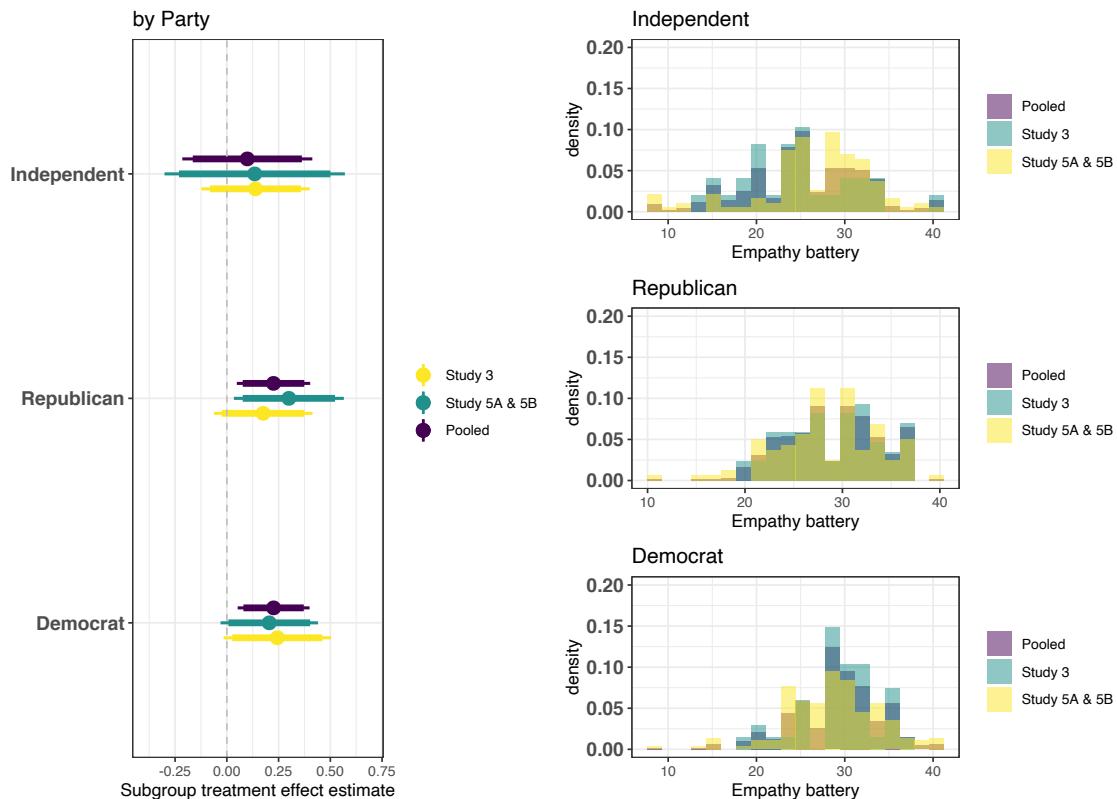

Figure I.29: Left panel: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by party subgroup. Right panel: density distribution of baseline empathy battery score by party subgroup.

**by Trump and Biden approval** Trump approval was measured in Study 3 under the question of presidential approval as Donald Trump was the then president-in-office; in Studies 5A and 5B to follow Joe Biden had taken office and so two questions were asked – one for presidential approval for Joe Biden, and a second on approval for former President Donald Trump. Figure I.30 presents subgroup analyses for Trump approval while Figure I.31 presents subgroup analyses for Biden approval.

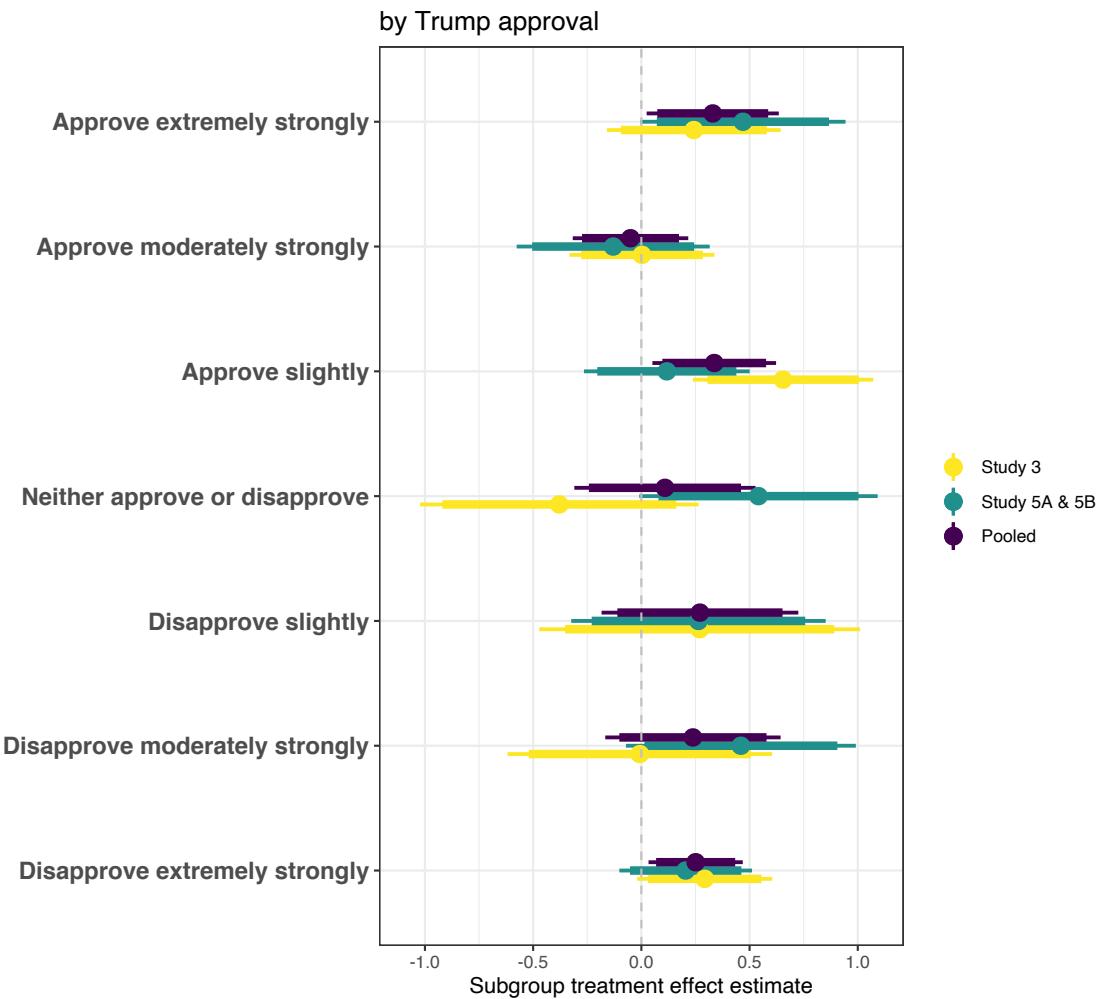

Figure I.30: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by Trump approval subgroup.

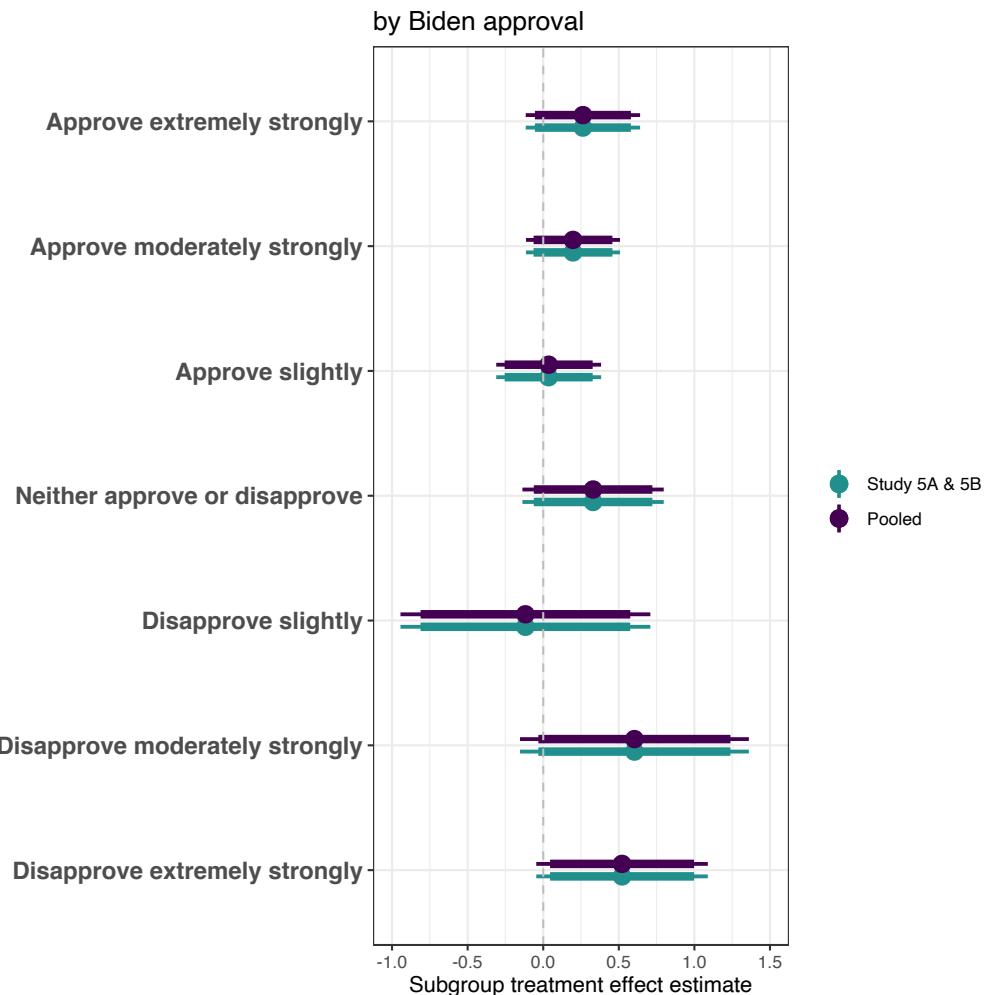

Figure I.31: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by Biden approval subgroup.

**by Race** Race subgroups presented are Black or African American (“Black”), White, and a combined grouping of Asian, Hispanic, Latinx, Native Hawaiian, Pacific Islander and Other (“Other”) given the small sample sizes of the race subgroups. Figure I.32 presents subgroup analyses by race.

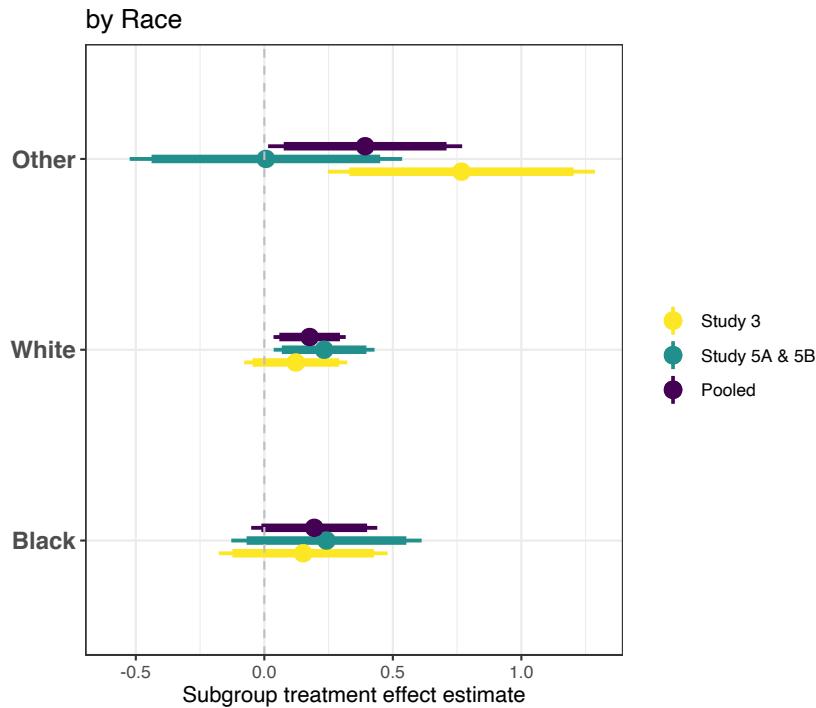

Figure I.32: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by race subgroup.

**by Education** Our most disaggregated coding for education level has too few observations for some categories for within-subgroup estimation of treatment effects, so we aggregate to three general categories, bundling "Some high school, but did not graduate" and "High school or equivalent (GED)" to "HS", combining "Some college, but did not complete a degree" and "Bachelor's degree (BA/BS)" and "Associate degree" to "College", and "Master's degree (MA/MS/MBA)" and "Medical (MD), law (JD) or other doctoral degree (PhD)" combined to "Postgrad". In Study 5B we had an extra category for "no schooling completed" but since this was a single respondent we drop this category throughout. Figure I.33 presents subgroup analyses by aggregated education level.

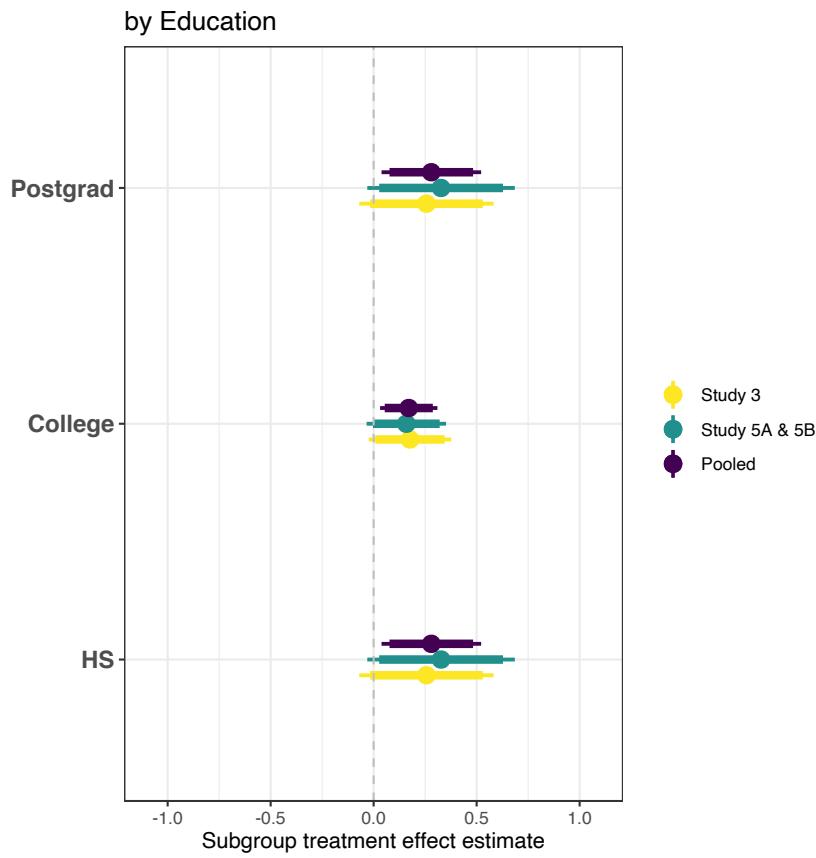

Figure I.33: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by education subgroup.

**by Sex** Figure I.34 presents subgroup analyses by respondent sex.

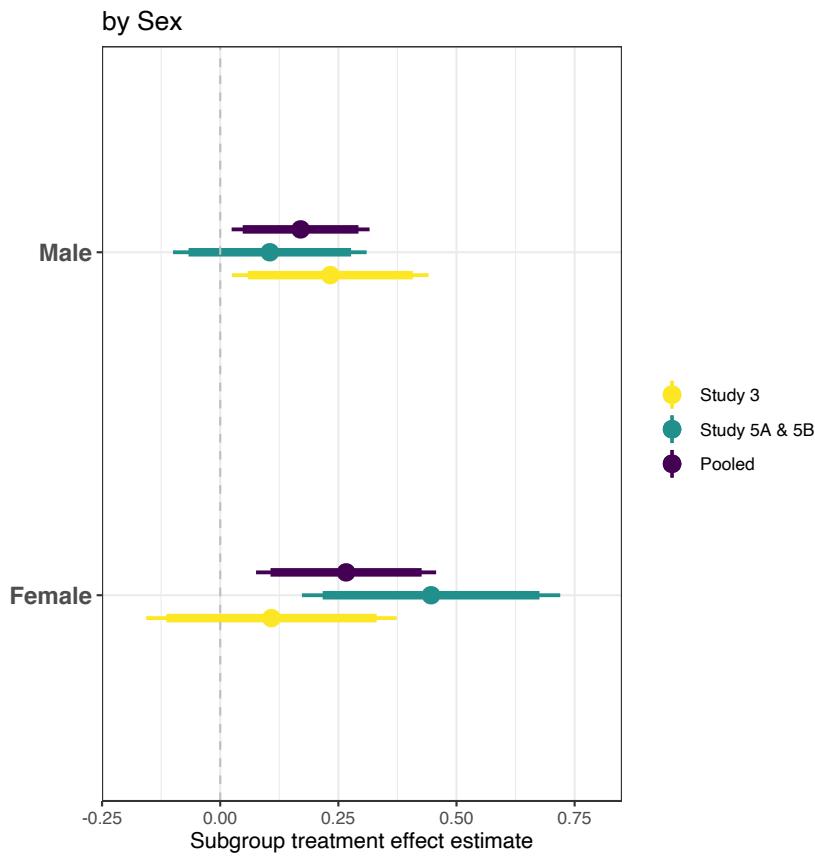

Figure I.34: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by respondent sex subgroup.

**by baseline empathy** Estimates of correlations between treatment and outcome by baseline empathy battery terciles (low, medium and high) presented in Figure I.35.

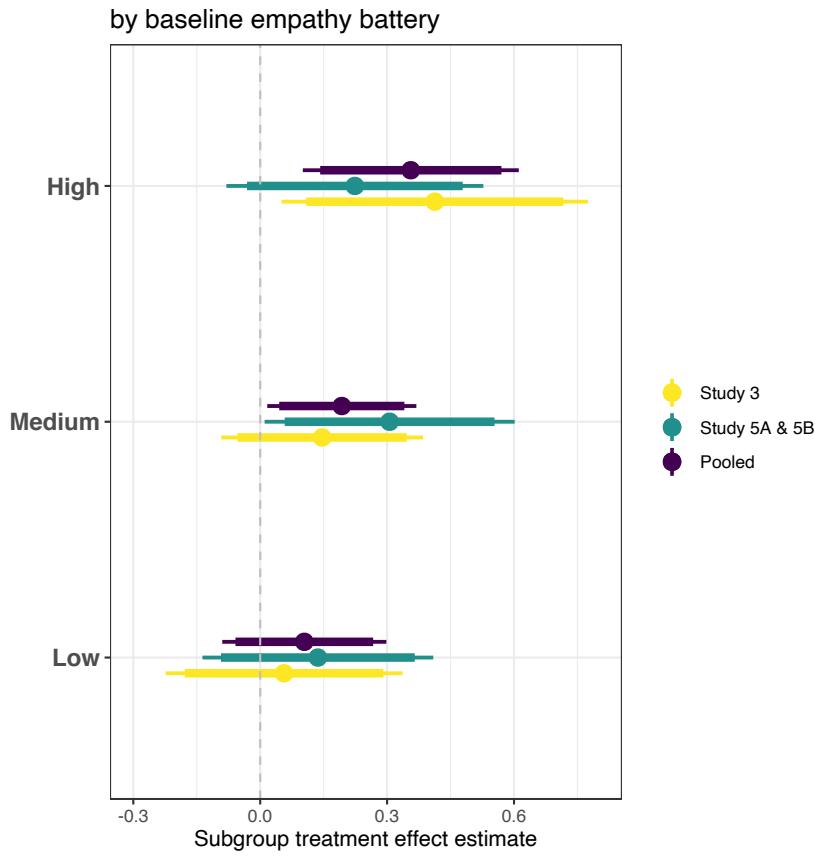

Figure I.35: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by respondent base empathy battery tercile.

**by Attentiveness** We look at subgroup effects by respondent attentiveness in Studies 5A and 5B (where the peer praise and task choice outcome are both measured for respondents over several trials) and look at attentive (respondents who pass the multiple choice attentionMC and grid attentionG attention checks), somewhat attentive (pass only attentionMC or attentionG but not both) and inattentive respondents (pass neither check). See Appendix Section B.4 for details. Figure I.36 presents estimated treatment effects of peer praise for empathy on choosing the empathy task within each of these subgroups.

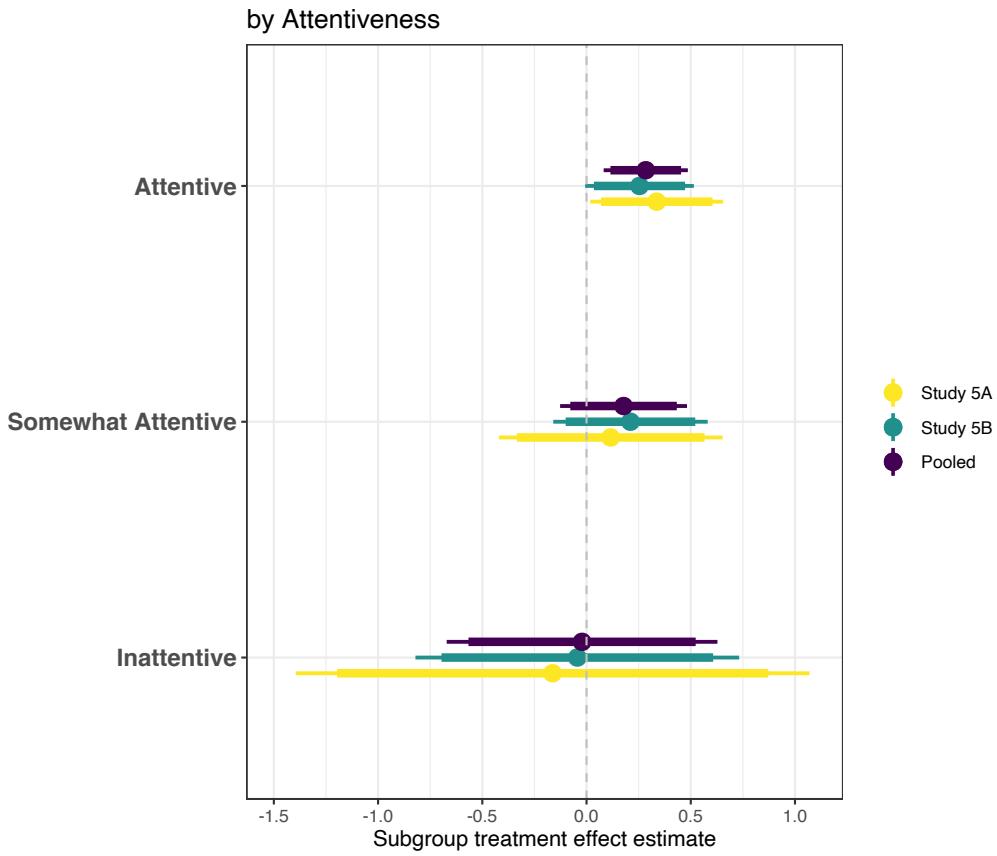

Figure I.36: Logistic regression estimated peer praise for empathy treatment effect on log likelihood of choosing empathy task, by respondent attentiveness.

Study 5 was composed of two days' worth of survey experiments, which we refer to throughout as 5A and 5B. 5A included 20 trials of the main task for all respondents, while 5B included 3. We additionally

## I.2 Fading effects of peer praise

Figure I.37 presents estimated average causal marginal effects (ACME) and total effects (TE) or peer praise for empathy (through happiness) over successive main task trials.

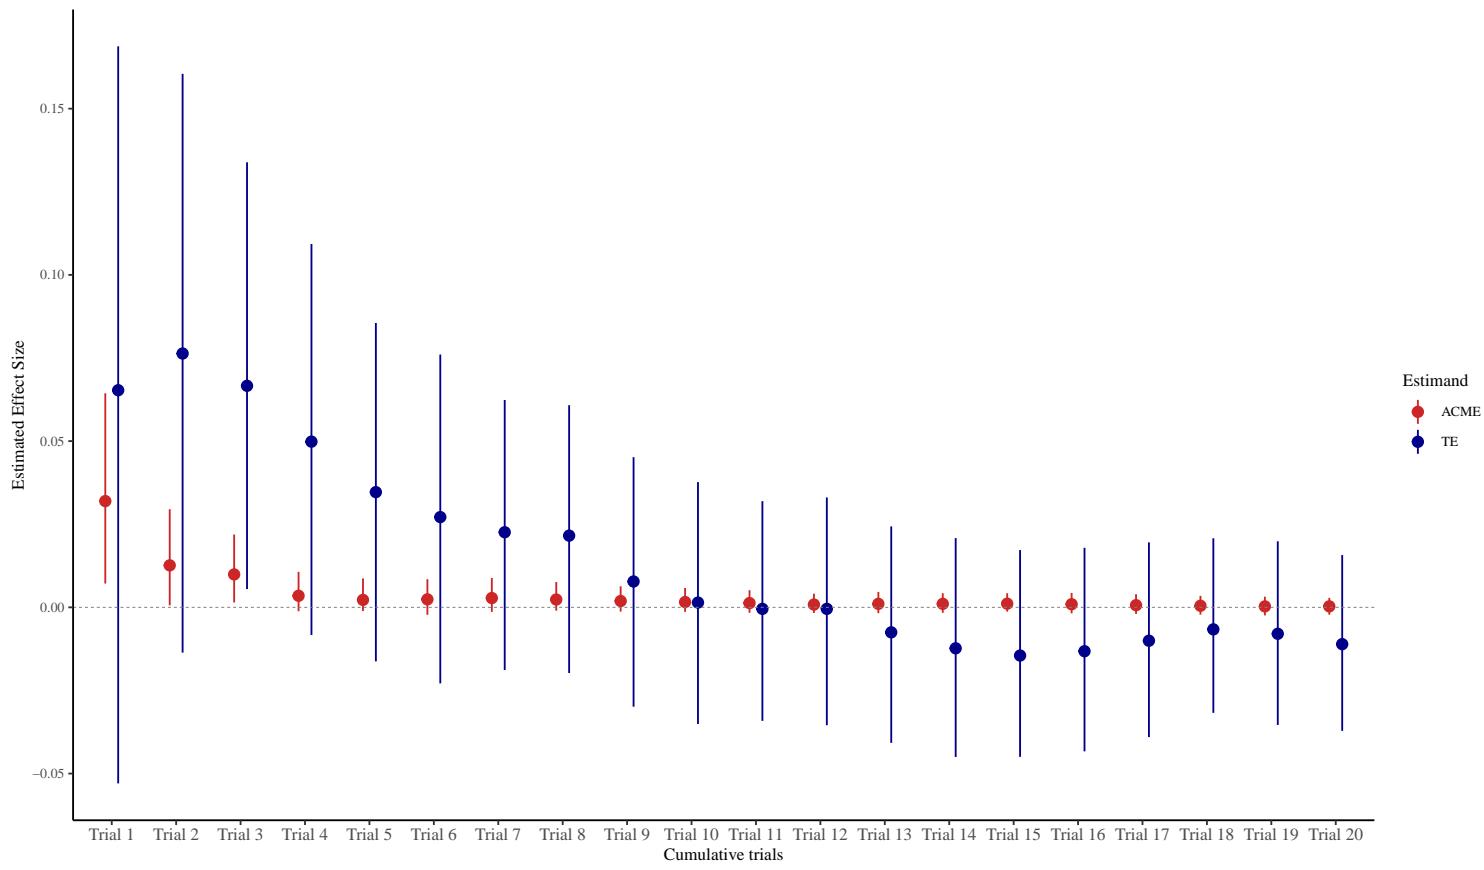

Figure I.37: ACME and TE effects of peer praise (through happiness) over successive trials.

## J Ethical considerations

All of the studies conducted in this project received IRB approval and exemption through the University of Wisconsin Madison Educational and Social/Behavioral Science IRB (# 2020-0843-CP002).

**Fair wage** In establishing pay scales for each study, we conducted pilots to establish average times for pre-treatment, task and post task portions of each study design and paid based on the state with the highest minimum wage in mid 2020 (Washington, at \$13.50 per hour). Our intention was to offer fair wages especially in the context of work showing the median wage of MTurk workers is ~\$2/hour (Hara et al., 2018).

**Negative treatments and distress** In our studies we intentionally avoided negative affect in interactions as much as possible, by not providing negative peer feedback or emphasizing negative emotions when exploring mediators.

**No deception** Our studies incorporated a strict no-deception of respondents rule throughout, which in part motivated and necessitated Study 2 – garnering real peer praise and validating its authenticity.
